The Standardization of Surgical Services

by **J. V. McKENNA**

Associate Professor of Industrial Engineering, Syracuse University

THE standardization of surgery has been a topic of discussion among surgeons for about forty-five years. During this time, about nine articles on the subject have been published by reputable medical journals on this continent. These articles range from speculation as to the probable advantages of standardization to a variety of attempts to analyze the situation experimentally.

The earliest proponents of standardization in surgery seem to have anticipated its major advantages rather well.

1. Determination of the best method of doing things (2) (5) (6).
2. Universal usage of the best method (2).
3. Reduction of operative time (3) (5).
4. Reduction of risk through:
   a. Reduced span of concentration (3) (6).
   b. Greater individual skill (3) (6).
   c. Improved teamwork (6) (9).
5. Greater facility in training surgeons (3) (5) (6) (8).
6. Financial economy (5) (6).
7. Reduced fatigue (6) (8).

These advantages if only partially realized, would be well worth the cost of achieving them. Despite the forty odd years which have passed since the idea was first brought forward, however, little standardization has been accomplished. Aside from a few procedures which are performed in about the same way everywhere, methods differ greatly from one surgeon to another, or at least from one medical school to another. There are often half a dozen ways of carrying out the same procedure and apparently little concern that one of them may be much superior to all the others.

RESERVATIONS ABOUT STANDARDIZATION

The major objections raised by surgeons to any attempt to analyze surgical techniques may be listed as follows:

1. There is no "best" way of performing a surgical operation. Cases differ and so do surgeons. Different methods are made necessary by the different conditions under which surgery is carried out.
2. Speed-up is not consistent with the welfare of the patient. The purpose of surgery is the welfare of the patient. It cannot be sacrificed to save time. Everything which ought to be done must be done and done carefully.
3. The time to be saved is not of great consequence either to the patient or to the surgeon. Anesthesia is improving, surgical shock is being reduced and even in complicated procedures like open-heart surgery, the blood-oxygenator provides adequate time for complicated repairs.
4. The advantages to be gained from standardization are only speculative. They have never been properly demonstrated.

COMMENTS REGARDING RESERVATIONS

It is not difficult to argue with most of these views on purely logical grounds. Perhaps the best arguments may be summarized as follows:

With regard to method, the Industrial Engineers reason that if there are several ways of doing the same thing, all are not likely to be equally good. They, therefore, advise taking the better elements from each of the methods extant to construct a new method which should be better than the others. Then everyone should use this "best" method. In general, the surgeons seem to appreciate this argument but contend that the different techniques for performing the same surgical procedure are not really for doing the same thing. The patients are different, the surgeons are different, and the anomalies they are seeking to correct are different from one patient to another. Not only this, but often the exact nature of the anomaly is only revealed by surgery so that previously made plans have to be revised. Thus, it is desirable to have half a dozen ways from which to choose.

On the other hand, there have been prominent surgeons who have argued that there is one best way of carrying out a surgical procedure. Lawrence and Berry stated quite unequivocally that, "We believe that there is one best way of performing a surgical operation" (6). Along the same lines, McCarty wrote, "It is advisable in addition to standardize every motion procedure so that a fixed type of operation can be used in every case in which variations from predetermined technic are not indicated" (8).

It is worth pointing out in regard to the one best method argument, that a surgical procedure, like any manual activity, is made up of a number of elements. How large these elements are depends upon how finely the operation is divided. For some purposes, it may be divided into four elements, preparation, dissection, re-

pair and cleanup. For other purposes, it may be divided into literally hundreds of disparate units, such as retract, suture, etc. Some of these small units of work may be performed in dozens of ways. Take suturing for example, one may decide to use intermittent or continuous suturing or select from a variety of suturing materials. No engineer can specify which is best in a given case. That is the job of the surgeon, but when the choice has been made, what is the best set of motions to perform the desired function? That is the job of a work analyst and it needs a professional. If standard surgical techniques are possible, they will be combinations of best methods for performing small elements of work. But, whether they are possible or not, it may still be worthwhile to seek out the best way of performing the elements.

Objections to standardization on the grounds that it encourages speed-up can be sustained only on the basis of ignorance of the true purpose of standardization. Speed-up implies haste. It suggests speed as an end in itself or as a means of financial economy without regard for care, safety or even the performance of a complete job. Far from encouraging speed-up, standardization prevents it. Webster defines a standard as "that which is established by authority, custom, or general consent as a mode or example . . . that which is proper and adequate for a given purpose" (12). Thus, the first requirement of a standard is that it be proper and adequate for the purpose intended. Thus, where slowness and deliberateness seem appropriate in the interest of safety, proper standardization would recommend it. Previous investigators in this field are in complete agreement on this subject. Gilbreth writes, "In no way does the increased efficiency due to motion study 'speed up' the surgeon nor give him more to think about at critical times" (3). Regarding the same point, Lawrence and Berry wrote, "We especially wish to note that this is not a speed-up but rather, a case of 'no haste, no waste' and that the time saving comes entirely from the economy of motions and improved sequences without increase in the rapidity of any motion" (6).

The argument that the amount of time which can be saved is not of consequence either to the patient or to the doctor, is based on a number of assumptions:

1. The amount of time to be saved has been estimated with some accuracy.
2. That the principal purpose in saving time is to shorten the operation.
3. That time is the only saving involved.

None of these assumptions are entirely warranted. Some authorities have ventured a guess at the amount of time likely to be saved, "more than 10%" (5), but never has an estimate of the time to be saved, accompanied by a measure of its reliability, been worked out. Thus, any attempt to place a value upon the time to be saved is premature. Certainly a substantial reduction in the time required to perform an operative procedure would be of value to the patient and even a quite small saving of time might make the difference between success and failure in a few critical cases. However, the main purpose of saving time is not to reduce the length of the operation but to make possible more surgery in a given length of time, deliberate careful work where it is needed, and time for more rest, more analytical work, and a more complete and careful job generally.

The final argument that the advantages to be gained through the standardization of surgery have never been demonstrated, is more difficult to answer. One may say that they are professional opinions of surgeons stated in their best technical publications. There is considerable agreement among them, but some differences also. The facts to support their views are not conclusive. Take, for example, the question of supply tables. In 1939 Lawrence and Berry (7) recommended:

1. Dividing the instrument supply tables into two units, one for instruments and the other for supplies.
2. Using special semi-circular tables with their total area within the user's normal grasping area.
3. Re-arranging the various tables in the operating room to facilitate the free flow of supplies and instruments from the nurses and back again.

They provided diagrams of layouts for three general classes of operations. These changes were designed to: a. minimize reaches and moves, b. encourage the synchronous use of both hands, c. enable the whole surgical team to face the operative field continuously and d. reduce fatigue.

McCarty says of the Lawrence and Berry arrangement, "Although theoretically an ideal plan, the system seems to restrict the free area about the operative field when more than one surgical assistant is used, and the supply nurse seems to be placed dangerously near the anesthetist" (8). The divergent views of these men regarding layout are given quite simply as opinions. Neither attempted to support his views with data. Nevertheless, Lawrence and Berry and McCarty seem to have produced the best investigations in the field so far. The observation that their conflict over layout seems to be based on opinion rather than substantial data can be applied equally well to all the work done in this field, a short resume of which is given in the abstracts from American references at the end of this article. What seemed to be needed is a scientific method for analyzing surgical operations.

In a recent article in a British medical journal, Sir James Patterson Ross comments upon this need (13):

> Trotter pointed out very clearly the conflict that exists is between a practical art like surgery, success in which depends upon judgment, intuition and skill, and the exactitude of science which demands the elimination of the human faculty. Yet this conflict must not be made the excuse for failing to make clinical methods as accurate as possible. The clinical scientist has to attempt to resolve the conflict by devising methods of investigation, the results of which can be correlated with clinical observation.

Motion study is one such method. No informed person will argue that it is perfectly adequate but it has been steadily improved and is capable of further development to fit special needs.

THE KINDS OF EXPERIMENT NECESSARY

The analysis of a surgical service is not a simple thing. So many activities are involved, so many facilities, so many people, all from different levels in the hospital hierarchy and outside, and all with their own special interests which often seem most important to them. Some of the things which ought to be analyzed are the following:

1. Efficient use of the surgical service; schedules, cancellations, delays between operations, preparing and cleaning up the operating room.
2. Physical facilities and their arrangement; the arrangement and design of rooms—operating room, scrub room, radiological and pathological facilities; design and arrangement of tables, stands, and other ancillary equipment; design and arrangement of instruments.
3. Preparation of the patient; positioning, draping, anesthesia, etc.
4. Delays in surgery; teamwork, communications, pre-operative planning, training of assistants, etc.
5. Perfection and standardization of surgical techniques; the balance of work between surgeons and assistants, the balance of work between the body members of the surgeon, etc.

Some of these studies will be gross, mechanical and routine. Methods adequate for investigating the efficient use of the surgical service, the physical facilities and their arrangement, and the preparation of the patient are already available to us. Micromotion study, in its present form seems nearly adequate for studies leading to the standardization of surgical techniques. However, there exists a serious lack of methods adequate for isolating the subtleties of teamwork and communications. In this area, creative work of the highest order will be needed.

PROFESSIONAL METHODS ANALYSTS NEEDED

The surgeons need not and should not attempt methods analysis on their own. During an operation, the surgeon must concentrate on the task at hand. He has no time to think of the generality of such operations, to observe the movements of his assistants or to speculate upon the origin and causes of delay. He is a part of a surgical team and of the communication system which enables it to function. He cannot stand back to observe either impersonally. In additon, methods analysis requires special interests and special techniques. The function to be studied will demand not only all the know how, but all the ingenuity and creative ability of the professional methods analyst.

As an example of the kind of problem involved, we may consider the relationships which exist between teamwork, communications, authority and method as they apply in the operating room. In this regard, Temple Burling writes as follows (11):

> What is actually happening is that the changing needs of the patient as they develop in the course of the operation, determine what everybody does. When the surgical team has worked long enough together to have developed true teamwork, each member has such a grasp of the total situation and of his role in it, that the needs of the patient give unequivocal orders. This is the highest and most efficient type of cooperation known. It is so efficient that it looks simple and even primitive. It is possible only where every member of the team knows not only his own job thoroughly, but enough about the total job and that of each of the other members to see the relationship of what he does to everything else that goes on.

It is apparent that this type of cooperation can be achieved only under circumstances where each member of the team is able to perceive for himself the changing needs of the patient. This would seem to imply that each member of the team should have an uninterrupted view of the patient and the instruments which record his physical condition. Lawrence and Berry agree, "An operation should have the continuous undivided attention of the whole operating team. It should not be necessary for any of them to turn around at all" (7). Temple Burling states that this degree of cooperation is based upon everyone knowing his own job, the total job, and that of each of the other members of the team. It is developed through working together. Unfortunately the opportunity to work together as a surgical team is not easily come by in the large modern hospital. Thus, a standard technique would seem to be a shortcut toward the kind of cooperation that seems desirable. Here, again Lawrence and Berry agree, "Good teamwork can only be expected if all understand the same technic" (6). There are many things that one would like to know about this relationship. Would the adoption of a standard technique make possible the achievement of a higher level of teamwork? What effect would it have upon the amount of practice a team needed? How often is this ideal of communication achieved, and when it is not, what takes its place? What conditions encourage it? What conditions inhibit it? These are questions which cannot be answered from present knowledge nor even with present analytical techniques. The engineer who chooses to specialize in the study of surgical techniques will have to learn to work on two frontiers at once. On the medical frontier, he will attack each problem with the best analytical tools available. On the engineering frontier, he will try to develop the new tools needed to solve new problems. He will need creative genius more than mere technical competence.

The basic problem is an old one; to prove that standardization is appropriate in an area of manual activity where its potential is not immediately apparent. But standardization has been proven useful in hundreds of such areas. It is not long ago that standards in maintenance were considered impractical. Now they are fairly common. In surgery there is understandably a little more

reluctance to begin and it seems reasonable to expect that more solid proof will be needed for acceptance. But the cumulation of a series of well-designed and well executed experiments will ultimately provide the answer one way or the other. And the answer is worth obtaining now.

REFERENCES

(1) Nock, Albert J., "Frank Gilbreth's Great Plan to Introduce Time-Study into Surgery," *American Magazine*, Vol. 75, March, 1913, pages 48-50.

An article by a popular writer in a popular magazine of the time. It is important only because it appears to be the first publication regarding the use of motion study in surgery.

The purpose of the article seems to be to introduce Gilbreth's ideas regarding the use of motion study in surgery, but it goes on to discuss hospital administration and particularly the idea of hospital administration by doctors. It points out that much inefficiency is built into the situation by the planning and architecture of the hospital itself.

(2) Dickenson, Robert L., M.D., "Standardization of Surgery: An Attack on the Problem," *Journal of the American Medical Association*, Vol. 63, No. 9, August, 1914, pages 763-765.

A serious article by a medical doctor in a first-rate medical journal.

The article points out the almost complete lack of standardization in surgery. "For the simple abdominal incision, where every factor may be worked out to standard, who has run a long course of tests? In stitching and tying, have we settled what are the swiftest motions as a peasant lacemaker has or do we ever go into training for correct form?" He points out that standardization is necessary in order to: 1. determine what is the best method of doing things, 2. promote the universal usage of the best method, 3. protect patients from incompetency, and 4. make possible the promotion of surgeons on the basis of merit.

The article is frankly a statement of the opinions of three men; Gilbreth, Taylor and Dickenson.

(3) Gilbreth, Frank B., "Motion Study in Surgery," *Canadian Journal of Medicine and Surgery*, Vol. 40, No. 1, July, 1916, pages 22-31.

F. W. Taylor believed "That the surgeon was the best mechanic and the best teacher of learners of anyone in any craft." Gilbreth reports that his recollection from more than 200 important operations which he observed, was at variance with Taylor's viewpoint. Nevertheless, he writes that "We proceeded to investigate the hospital from the standpoint of transference of skill, motion study, and measured functional management, that we might learn any advance methods of teaching the trades for use in connection with our work of installing scientific management.

"After visiting some of our most prominent hospitals, we found that the surgeons could learn more about motion study, time study, waste elimination, and scientific management from the industries, than the industries could learn from the hospitals. We then and there, decided to make a vigorous campaign to revolutionize the present methods of hospital management and to teach surgeons our methods of motion study, that waste in the transference of skill in surgery might be eliminated and that the best methods in the mechanical trades of the industries might be available and at the service of the surgeon and the managers of hospitals."

Gilbreth remarks about the great number of special tools used in surgery, and especially the unusual ones designed by surgeons themselves. He points out that this great multiplicity of tools makes it difficult for anyone to become highly skillful in their use. "Great practice with comparatively few tools is one of the laws of the most efficient use of tools."

Gilbreth remarks also about the lack of standardization in surgical technique. He implies that the main benefit of standardization would be the greater facility made possible in the training of new surgeons. He then goes on to describe the process of work measurement as it may be applied to surgery. He is quite certain that "the motions of the surgeon are then the units to be measured."

Gilbreth points out that "In no way does the increased efficiency due to motion study 'speed up' the surgeon, nor give him more to think about at the critical times."

(4) Pool, Eugene H., M.D. and Bancroft, Frederick W., M.D., "Systematization of a Service," *Journal of the American Medical Association*, Vol. 69, No. 19, November, 1917, pages 1599-1603.

A report by two medical doctors of some elementary methods work performed by them in the operating room. They are sold on systematization or standardization for the same reasons that Dickenson was. In addition, they point out that "with the large service of the present day (1917), the complicated methods of diagnosis, the large staffs and the rapid turnover, systematization has become essential."

The article goes on to explain the work done by the authors in three areas: 1. The analysis of operative results, 2. Arrangement of work in the wards, 3. Operative techniques. The movements of nurses were analyzed using flow chart principles and economies were effected by rearranging the room, replacing small instrument tables with larger ones and by providing instrument tables of adjustable height. A hand signal system was adopted to facilitate communication between the surgeons and the instrument nurse.

(5) Welton, Thurston Scott, M.D., "In Regard to 'Rhythmic Surgery,'" *American Journal of Surgery*, Vol. 41, No. 3, September, 1938, pages 371-372.

This is an editorial rather than an article introducing "The first of a series of papers on improvements of surgical technic and operating room management, based on studies of motion and efficiency," by Doctors W. H. Lawrence and C. H. Berry.

The author points out that despite the great improvements in manufacturing procedures resulting from motion study in industry, the surgeon "has maintained his right to follow his personal methods, to train his assistants in those methods, and to use whatever instruments, supplies and technics he found advisable." The result has been that a. It is impossible to determine for a given condition which surgical technique is best. b. The procedures used are unnecessarily economically wasteful and inefficient. c. Personally trained assistants find difficulty working with others. d. A wasteful reduplication of instruments. e. Repeated changes in the operating room. f. An excess of assistants and nurses are needed. He points out that "Few scientific studies have ever attempted to simplify the myriads of procedures, find their common denominator and evolve a best way for the performance of each step."

(6) Lawrence, W. H., M.D. and Berry, C. H., M.D., "Rhythmic Surgery," *American Journal of Surgery*, Vol. 41, No. 3, September, 1938, pages 393-398.

Doctors Lawrence and Berry believed that, "Success in any field where manual movements are required, is marked by outstanding rhythm (measured and balanced move-

ments)." They, therefore, became personally competent in micromotion analysis and made studies of appendectomies for the stated purposes of a. eliminating unneccessary motions, b. making the motions used more effective, and c. building up a sequence of motions for maximum efficiency.

This appears to be the first actual use of micromotion study to analyze surgical procedures. Doctors Lawrence and Berry perceived a problem and sought out a method for solving it. Perhaps their final opinion is given in the first page of their article, "We now believe that all surgeons can achieve real skill and true rhythm through motion study of their own activities; thus we are convinced that the practice of motion economy as applied to industry should be widely used in surgery."

(7) Lawrence, W. H., M.D. and Berry, C. H., M.D., "Rhythmic Surgery: Arrangement of the Operating Room," *American Journal of Surgery*, Vol. 43, No. 3, March, 1939, pages 669-674.

The second article by Lawrence and Berry deals with the arrangement of the operating room. It recommends: 1. The operating room should be of ample size. 2. A separate room adjoining the operating theatre should be used for the administration of anesthetic in order that the patient may be moved into the already prepared operating room rather than having the arrangement assembled about the operating table after the patient has been brought in. 3. The instrument and supply tables should be redesigned in order to: a. minimize reaches and moves, b. encourage the synchronous use of both hands, c. enable the whole surgical team to face the operative field continuously, d. reduce fatigue. 4. The instrument and supply tables should be divided into two units in order to provide for nurse training under the supervision of a registered nurse. 5. The tables for instruments and supplies should be symmetrical and with their contents so laid out as to facilitate the almost equal use of left and right hands. 6. The instruments should be kept in a fixed location in order to avoid searching thus enabling the surgeon to keep his eyes on the operative field. Commonly used instruments should be pre-arranged for the surgeon to pick up for himself. 7. The instruments to be picked up by the instrument nurse should be pre-arranged so that she may pick up the instrument she wants automatically without looking for it.

(8) McCarty, Franklin B., M.D., "Motion Study in Surgery," *American Journal of Surgery*, Vol. 65, No. 2, August, 1944, pages 197-209.

The preceding articles may seem quite ancient but the present one by Franklin B. McCarty, M.D., is of World War II vintage and modern by any standards.

McCarty explicitly recommends the standardization of surgical technique on at least seven specific occasions. The extent to which he would carry standardization is quite clear from the following quotations: 1. "It is advisable, in addition, to standardize motion procedure so that a fixed type of operation can be used in every case in which variations from predetermined technic is not indicated. Failure to adopt and carry out a repetitive technic in any one kind of operation may mean that no outstanding method has been developed or may indicate lack of thorough organization of a surgical group." 2. "Fixed types of operation can be applied to large groups of cases. These should be specified and carried out uniformly by the entire surgical service and variation or additions should be considered and discussed by the group before being introduced by an individual member." 3. "No single time standard can be set for different men but use of uniform methods will permit each man to complete the work in the shortest time compatible with his talents." 4. "A standard method of skin preparation, positioning and draping should be adopted." 5. "Proper training should begin the first day the young interne begins his training in operative surgery and it is important that they not be permitted to practice methods which must later be unlearned." 6. "Material such as sponges, pads, sutures should be reduced to the smallest variety that will adequately serve the purpose." 7. "Instruments should be the simplest in design and fewest in number that will permit carrying out of the entire procedure."

Literally THOUSANDS OF FACTS

to aid you in plant management and engineering

New—Second Edition

PLANT ENGINEERING HANDBOOK

Prepared by a Staff of Specialists

WILLIAM STANIER, Editor-in-Chief

2391 pages, 6 x 9, 1664 illustrations, $23.50

Here is a book that brings to the men responsible for "housing" American industry a professional handbook comparable in quality and thoroughness to the best available to other engineering groups—a reference guide of thousands of facts, carefully aimed at the particular needs of plant operating personnel.

Whether you're searching for a basic introduction to some field of plant set-up or operation, or for specialized information on apparatus, materials, services, or processes, you will find the information here, treated in the degree of detail you want.

Every section is prepared in such a way as to give you a grounding in the fundamentals of the subject, and then in the fine points of practice, application, recommended methods, etc. The 92 major areas of the plant management and maintenance job are grouped in areas ranging from methods of placing foundations to laws governing the patenting of engineering devices. This reference brings these and many other subjects together in a single convenient handbook.

The book has been written by men with broad training and experience—experts of national repute who have been selected from more than 50 of the leading industrial organizations and educational institutions in the United States.

Whether it is a matter of measuring performance of individual producing units and setting goals of improvement, or simply adjusting a V-belt drive for proper tension . . . of picking the right paint for the job, or choosing the proper hanger for insulated pipe . . . of dealing with a corrosive condition, or safeguarding against fire hazards —the problem you have today or the one that will confront you tomorrow, is covered concisely in this book.

Inventory Policies and Related Numerical Approximations

by CHARLES E. CLARK *and* ALAN J. ROWE

System Development Corporation

IN BRIEF outline, the problem of this paper is the following. Stocks are maintained to meet a demand. When the stock level reduces to X items, action is initiated for stock replenishment of Y items. The problems is to determine X and Y in the light of costs of carrying stock in inventory, costs of ordering stock replenishment, a run-out percentage, and the statistical properties of customer demand and lead times.

Effective mathematical solutions exist and are presented. However, the mathematical details of these analyses require more time, mathematical ability, and computational efficiency than one wishes to require of operating personnel. The distinctive contribution of this article is the presentation of an approximate solution of the problem. The approximation is concerned with economic order quantities and safety stocks rather than the more complex, but ideally preferable model, of the mathematical statistician. The simplified procedures are closer to the intuitive insights of the Industrial Engineer, and the calculations are within the capability of a statistical clerk untrained in engineering or advanced mathematics.

The approximate solution is of the folowing type. If the customer demand could be predicted with certainty, and if the lead time for stock replenishment were known with certainty, the selection of the replenishment level X would be trivial. One would order replenishment to arrive exactly when stocks become exhausted. Furthermore, the replenishment quantity Y could be determined by the classical economic order quantity formula presented. If, however, customer demand or the lead time is uncertain, the replenishment level X can not be so determined. In such cases, it is common practice to take X equal to an average demand during lead time, plus a "buffer" or "safety" quantity of stock. The determination of the safety stock is a nonelementary problem which we shall by-pass at present. Simultaneously, the replenishment quantity Y can be determined by the economic order quantity formula. The resulting procedure has two apparent deficiences. In the first place, this independent selection of X and Y will not, in general, lead to the desired run-out percentage. This problem can be resolved easily by first calculating Y, and then determining the safety stock consistent with the required run-out percentage. A second deficiency seems more serious. The solution is not optimum. The economic re-order quantity formula is used where the conditions assumed in its derivation do not hold precisely (the derivation of the formula does not face the possibility of uncertain demand or lead time). However, this article shows that this relatively simple, ideally imperfect analysis, produces a result which differs very little from the optimum solution in many situations.

This fundamental objective of the paper is reached in section III. The exposition through that section is essentially nonmathematical. In later sections, the result is sharpened with the use of concepts of elementary statistics, such as those related to the normal distribution.

The two salient limitations of this article are the assumption of continual inventory surveillance, and the use of a run-out percentage rather than shortage cost. In many situations, stock replenishment must be ordered periodically, say, every Monday or on the first of each month. Such problems should be handled by the dynamic programming techniques of (1), (2), (4), and (5). Ideally, one should know the financial loss incurred when a customer order is received at a time of stock depletion. If this financial loss can be estimated, one can use the analysis of (3). However, one often finds that an analysis of shortage costs is impractical. In such cases, it is common for management to impose a service criterion in the form of a run-out fraction r which is used below.

The discussion is restricted to the analytical details of computing the optimum X and Y. We do not consider procedures for estimating the costs that appear in the formulas. Also, the problem of predicting demand is ignored. This problem, involving seasonality and trends in future demand, is in many situations more difficult than the problem of the present discussion.

I. THE ECONOMIC ORDER QUANTITY FORMULA

In later sections, we shall make use of the classical economic order quantity formula. The present section contains a derivation of that formula.

We assume that demand is predicted without error, and that there is a fixed lead time between initiation of stock replenishment action and the availability of the replenishment to meet demand. Hence, the replenishment can be ordered to arrive at the time stocks become exhausted.

This means that there is no problem in determining X, the stock level at which replenishment action is initiated. We shall determine Y, the replenishment quantity, to minimize a cost function constructed below.

Let C_o, the cost of ordering, be the dollar cost incurred each time action is taken to replenish stock. This is a cost per replenishment action.

Let C_i, the cost of carrying inventory, be the dollar cost of holding one item in stock for one day. Often, C_i, is expressed as $CI/365$ where C is the dollar investment in an item in inventory, and I is an annual interest rate. Let D be the daily customer demand which we assume constant. The number of days between replenishment actions is Y/D. The number of replenishment orders per year is 365 divided by this number, or $365D/Y$. This, multiplied by C_o, is the annual cost of replenishment actions, and the cost per day of replenishment actions is DC_o/Y.

The mean stock level over a period of time is $Y/2$ because the low stock level is zero, and the high level is Y. This implies that the cost per day of carrying stock is $YC_i/2$.

The cost computed on a daily basis of replenishment actions, and of inventory is

$$C = \frac{DC_o}{Y} + \frac{YC_i}{2}.$$

This cost per day, C, is a function of a single unknown Y. When Y is small, the first term is large; when Y is large the second term is large; there is some value of Y, not too large or too small, for which the cost C is smallest. This optimum value of Y is

$$Y = \sqrt{\frac{2DC_o}{C_i}} \qquad \text{Eq. 1.}$$

which is derived as follows. The derivative of C with respect to Y is

$$-\frac{DC_o}{Y^2} + \frac{C_i}{2},$$

and if this derivative is set equal to zero and solved for Y, we obtain the result in question. Numerical illustrations of the use of this formula will appear later in the article. The formula has been known and used for decades.

II. NUMERICAL ANALYSIS OF THE GENERAL CASE

The economic order quantity formula was derived under the assumption that demand can be predicted with certainty. We shall show in section III that this formula can be used in more complex situations. But first we shall solve a general problem of choosing an inventory policy when demand is uncertain. The solution will be presented in terms of a specific artificially constructed example.

As the basis for an illustrative example, we shall use Table 1. In this table d is a possible value of the demand during lead time; the lead time being the time between

TABLE 1

Demand During Lead Time

86	.06	.26	1.05				

an instigation of action to replenish stock, and the time when the Y items arrive and are available to meet demand. The probability $P(d)$ in Table 1 is the probability that a demand during a lead time will be for d items. For example, Table 1 gives $P(80) = .10$, which means that we expect the demand during lead time to be for 80 items during 10 per cent of the lead times. The table indicates that the demand during lead time is always between 77 and 96 items, inclusive; a demand for 80 items occurs twice as often as a demand for 78 items, and ten times as often as a demand for 77 items.

Table 1 shows nothing about the lead time. We do not know whether it is fixed or variable. If the lead time varies from one replenishment action to another, this variation influences the variability of the demand during lead time. Also, the variability in the number of customer orders received per day influences the variability of demand during lead time. However, in Table 1 these two sources of variation are not separated. In section VII, we shall separate the variability of demand from the lead time variability.

In many real situations we do not know $P(d)$ accurately in the detail given in Table 1. However, no inventory policy can be set other than by pure guess-work if something is not known about the demand. Even if our knowledge of this demand is meager, such knowledge can be converted into a probability distribution like that of Table 1. This matter will be discussed in section IV. Sections V, VI and VII introduce systematic analyses applicable when information about demand is incomplete.

Table 1 contains a column of numbers $R(d)$, where $R(d)$ is the probability that the lead time demand will exceed d. For example, $R(96) = 0$ because the demand never exceeds 96, $R(95) = P(96) = .01$, $R(94) = P(95) + P(96) = .02$, $R(93) = P(94) + P(95) + P(96) = .03$, etc. Since the table gives $R(90) = .10$, we know that the lead time demand will exceed 90 items, i.e., be 91 or greater, during 10 percent of the lead times. The values of $R(d)$ are quickly computed in succession by the formulas $R(95) = R(96) + P(96)$, $R(94) = R(95) + P(95)$, $R(93) = R(94) + P(94)$, etc.

A number, $S(d)$, in Table 1 is the expected number of

customer orders received during a lead time after stock is depleted if the replenishment action is initiated when the stock level is $X = d$. For example, we find that $S(90) = .28$. To interpret this number, we suppose that the policy is to order stock replenishment when the stock reduces to $X = 90$ items (here, as elsewhere, stock is the stock on hand plus replenishment previously ordered and not yet delivered). If this policy is continued over a long period of time which covers many replenishment actions, the mean shortage per replenishment action is expected to be .28 items. The fact that $R(90) = .10$ implies that a shortage of zero can be expected during 90 percent of the lead times. If such zeros are averaged with the numbers short during the other lead times, the mean is expected to be .28. Hence, the shortage will average slightly more than one item every four replenishment actions. We should not confuse $S(d)$ with the average shortage in those instances in which shortage occurs. If replenishment action is initiated when the stock level is 90, the expected number of shortages during the 10 percent of the times that a shortage occurs is $S(90)/R(90) = .28/.10 = 2.8$ items. However, this last number does not enter the analysis.

The calculation of $S(90)$ could proceed as follows. The expected shortage is 1 times the probability that the shortage will be 1 item, plus 2 times the probability that the shortage will be 2 items, plus 3 times the probability that the shortage will be 3 items, and so on. If replenishment action is initiated when the stock level is 90, $S(90)$ is 1 times the probability that the lead time demand will be for 91 items, plus 2 times the probability that the lead time demand will be for 92 items, plus . . ., plus 6 times the probability that the lead time demand will be for 96 items. In other words,

$$S(90) = 1P(91) + 2P(92) + 3P(93) + \cdots + 6P(96).$$

This sum is evaluated with use of values of $P(d)$ in Table 1.

However, a simpler and briefer calculation of the values of $S(d)$ is the following. $S(95) = S(96) + R(95)$, $S(94) = S(95) + R(94)$, $S(93) = S(94) + R(93)$, etc. We shall not pause to justify this procedure by proof.

We shall determine X, the stock level at which replenishment is to be initiated, and Y, the number of items ordered at each replenishment action. Here, and until we reach section IX, it is assumed that each customer order is for one item. We need to know the cost C_o of each replenishment action, the cost per day, C_i, of carrying one item in inventory, the expected daily demand D, and the expected demand during lead time μ. In addition, we shall need $S(d)$, and the run-out fraction r. If, for example, r were assigned the value .01, we would determine X and Y so that over a long period of time one can expect 1 percent of customer orders to arrive when stocks are depleted.

From an abstract point of view, the inventory process is cyclic. After stock replenishment is received, there ensues a period in which customer orders reduce the stock level to X. Then replenishment action is instigated, customer orders reduce the stock level until the replenishment arrives, and the cycle is complete. During any cycle there may or may not be a shortage.

If a customer order arrives when stocks are depleted, the customer may accept delivery after stock replenishment arrives, or he may cancel the order. Let p be the fraction of customer orders which can be so deferred. If $p = .90$, then 90 percent of the customers will accept delay in delivery, but 10 percent will cancel orders when stocks are depleted. Since $S(X)$ is the expected number of orders which are received each cycle when stocks are depleted, the expected number of lost sales each cycle is

$$(1 - p)S(X).$$

Since the stock input to the process is Y items each cycle, the average number delivered to customers each cycle is Y. Hence, the expected number of customer orders received each cycle is

$$Y + (1 - p)S(X). \qquad \text{Eq. 2.}$$

Since D denotes the expected daily customer demand, our estimate of the expected number of days in a cycle is

$$\frac{Y + (1 - p)S(X)}{D}.$$

The reciprocal of this can be interpreted as the expected number of cycles per day (which, in most cases, will be a fraction such as .01), and if this reciprocal is multiplied by C_o, we obtain

$$C_1(X, Y) = \frac{DC_o}{Y + (1 - p)S(X)}$$

as the cost of replenishment actions expressed as a cost per day.

We turn to the cost of carrying stock. If there were never any shortage, the expected low level of stocks just prior to replenishment would be X-μ, the reorder point less the expected demand during lead time. However, the low point is actually X less the expected number of customer orders filled during lead time. Since $S(X)$ is the expected number of customer orders that arrive when stocks are depleted, μ-$S(X)$ is the expected number of orders received and filled prior to the arrival of stock replenishment. Hence, the expected low stock level is

$$X - \mu + S(X).$$

When replenishment in the quantity Y arrives, some of this stock is used immediately to fill back orders. The expected number of these back orders is $pS(X)$, the probability that a customer will accept delay multiplied by the expected shortage during a lead time. Hence, the expected increase in the stock level at the time of replenishment is $Y - pS(X)$. The expected high stock level is the

expected low level, plus this last number which reduces to

$$X - \mu + (1 - p)S(X) + Y.$$

We shall use the arithmetic mean of the expected low and high stock levels as an estimate of the mean stock level over time. The use of this arithmetic mean is not legitimate if r is high, say, greater than .05. The analysis, in case of large r, will be indicated in section VIII. The mean of the high and low stock levels is

$$X - \mu + \left(1 - \frac{p}{2}\right) S(X) + \frac{Y}{2}.$$

The product of this mean stock level by the cost of carrying one item one day is

$$C_2(X, Y) = C_i \left[X - \mu + \left(1 - \frac{p}{2}\right) S(X) + \frac{Y}{2} \right],$$

the expected cost per day of carrying stock. The total inventory cost per day is

$$\begin{aligned} C(X, Y) &= C_1(X, Y) + C_2(X, Y) \\ &= \frac{DC_o}{Y + (1 - p)S(X)} \qquad \text{Eq. 3.} \\ &\quad + C_i \left[X - \mu + \left(1 - \frac{p}{2}\right) S(X) + \frac{Y}{2} \right]. \end{aligned}$$

More precisely, $C(X, Y)$ is a cost which varies with X and Y, whereas the total inventory cost, however it may be defined, may include other costs which do not vary with X and Y. In determining the best X and Y to employ, one can ignore all costs which do not vary with X and Y.

We must introduce the run-out fraction. Since $S(X)$ is the expected shortage during a cycle, we obtain using Eq. 2.

$$r = \frac{S(X)}{Y + (1 - p)S(X)}. \qquad \text{Eq. 4.}$$

This last equation contains the two unknowns X and Y, and it can be solved for Y in terms of X. We obtain after simple manipulation

$$Y = \frac{1 - r + rp}{r} S(X). \qquad \text{Eq. 5.}$$

If this value of Y is substituted into Eq. 3, the cost $C(X, Y)$ reduces to

$$\begin{aligned} C(X) &= C_1(X) + C_2(X) \\ &= \frac{rDC_o}{S(X)} + C_i \left[X - \mu + \frac{1 + r}{2r} S(X) \right]. \qquad \text{Eq. 6.} \end{aligned}$$

This gives the cost C as a function of a single variable X. The graph of C as a function of X can be drawn, and the low point of the graph corresponds to the optimum value of X.

We shall give a numerical illustration of the use of this formula. We assume that the distribution of demand during lead time is given in Table 1. We calculate that

$$\begin{aligned} \mu &= 77P(77) + 78P(78) + \cdots + 96P(96) \\ &= 84.0. \qquad \text{Eq. 7.} \end{aligned}$$

We assume that the expected daily demand is $D = 4$. (From $\mu = 84$ and $D = 4$ we could infer that the average lead time is $84/4 = 21$ days, but we do not explicitly employ the lead time in the formula for C.) We assume that $C_o = \$5$, $r = .01$, $p = \frac{1}{2}$, and $C_i = \$2/365$. This value of C_i could arise if each item in stock involved an inventory investment of \$10 and the annual interest charge were 20 percent. For these parameters $C(X)$ reduces to

$$C(X) = \frac{.2}{S(X)} + \frac{2}{365} [X + 50.5S(X) - 84].$$

To build up a table of values of $C(X)$, we take a trial value of X, say, $X = 90$. We find in Table 1 that $S(90) = .28$. Substitution in the formula for $C(X)$ gives $C(90) = .8246$ dollars per day. In this way, one builds Table 2. This table reveals that the best choice of X is $X = 87$.

TABLE 2

X	$C(X)$	X	$C(X)$	X	$C(X)$
80	1.1905	87	.4882	90	.8246
86	.4920	88	.5272		

To get the corresponding Y, we use Eq. 5. Since Table 1 gives $S(87) = .79$, and since $r = .01$, and $P = \frac{1}{2}$, we obtain $Y = 79$. Thus, the optimum policy is to initiate a replenishment action for 79 items when stock on hand plus replenishment ordered but not yet delivered reduces to 87 items.

We shall see in section III how the optimum value of X can be easily approximated. Then Table 2 can be quickly computed by taking a few values of X near the approximate optimum.

III. A SIMPLE APPROXIMATION

In this section we point out that a simple calculation will approximate X and Y as obtained by the analysis of section II.

We consider the problem of section II. We shall apply the economic order quantity of section I to this problem. The conditions under which the economic order quantity formula were derived do not hold in the problem now under consideration. This is due to the fact that in the present problem lead time demand is uncertain. The economic order quantity formula was derived for the situation in which one can predict in advance the time at which stocks will be depleted, and the lead time for replenishment is fixed. In such a case, one could plan to have replenishment arrive exactly when the stock level reduces to zero. In the more general case of uncertain de-

mand this is impossible. However, it seems reasonable to expect that a good policy under uncertain demand will be one in which the stock level is low at the time replenishment arives. Hence, the optimum replenishment quantity under uncertain demand should be at least roughly the same as the economic order quantity.

On the basis of this intuition, we shall return to the numerical example of section II and apply the economic reorder quantity. Using Eq. 1. and substituting the values $D = 4$ items, $C_o = \$5$, and $C_i = \$2/365$ used in section II, we obtain

$$Y = \sqrt{7300}$$
$$= 85.44.$$

One might compare this with $Y = 79$ of the optimum policy in section II. However, a more proper comparison will be made later after this value of Y is adjusted. From Eq. 5. we can solve for $S(X)$ in terms of Y. Using $Y = 85.44$, $r = .01$, and $p = \frac{1}{2}$, we obtain

$$S(X) = \frac{.01}{1 - .01 + .005}(85.44). \qquad \text{Eq. 8.}$$
$$= .86.$$

To solve for X we note that Table 1 gives $S(86) = 1.05$ and $S(87) = .79$. We interpolate to get

$$X = 86.7. \qquad \text{Eq. 9.}$$

Our solution $Y = 85.44$ and $X = 86.7$ must be rounded off to integral values. We select $X = 87$ and compute the corresponding Y from Eq. 5. to be

$$Y = \frac{1 - .01 + .005}{.01} S(87),$$

and after obtaining from Table 1 the value $S(87) = .79$, $Y = 78.6$ which we round off to $Y = 79$.

Thus, we determined a value of Y, namely, $Y = 85.44$, by use of the economic order quantity formula. Corresponding to this value of Y there is only one X which will give the required run-out fraction of $r = .01$. This X is determined from Eq. 5. to be $X = 86.7$. In rounding off to integers we first adjust X to 87, and then the Y corresponding to the adjusted X is determined from Eq. 5. This last adjustment of Y guarantees that the run-out fraction will be $r = .01$ as required.

Since the computations of the present section employ the economic order quantity formula in a situation with uncertain demand, we do not have mathematical proof that our results are sound. In fact, we do not expect to obtain the optimum as it is correctly derived in section II. But comparing the results of this section with the optimum policy obtained in section II, we find that the approximate method gives the X and Y of the optimum solution. However, it must be remembered that the two results were not identical before initial solutions in fractions of an item were rounded off to integral values.

Suppose that one did not trust the approximate procedure of this section, and the exact analysis of section II were to be employed. It would be efficient to compute the economic order quantity $Y = 85.44$ and the corresponding $X = 86.7$ as was done in the present section. One would then build up a table of values of $C(X)$ for values of X near 86.7.

The approximate solution will not be so accurate for some values of the parameters, C_o, C_i, r, D, and p and for some distributions of lead time demand. Management should make a few computations by the methods of both sections II and III. In this way, it can be determined whether the approximation is adequate for the specific parameters and demands faced by a specific management. In most cases, it will be found that the approximate computations can be adopted.

IV. THE DISTRIBUTION OF LEAD TIME DEMAND

The analyses of sections II and III require the distribution of lead time demand as illustrated in Table 1. Usually one's information is incomplete, and the distribution must be approximated. For such an approximation it is usually best to use one of the analytical models of sections V and VI. However, we shall indicate in this section how the distribution of lead time demand can be approximated by elementary methods.

Suppose as a trivially simple illustration, we assume that the lead time demand is always between 1 and 5. We know that 3 is the most likely demand, and that 1 and 5 are less likely than 2 and 4. Nothing else is known. One might assume that the probabilities of demands of 1 and 5 are equal. In other words, $P(1) = P(5) = x$, where the unknown x is to be determined. It might seem reasonable to assume that $P(2) = P(4) = 2x$, and $P(3) = 3x$. Since the sum of the probabilities must be 1, we would have $x + 2x + 3x + 2x + x = 1$, or $9x = 1$. This would give $x = 1/9 = .11$, approximately. Finally, $P(1) = P(5) = .11$, $P(2) = P(4) = .22$, and $P(3) = .33$.

Alternatively, one might have the conviction that the demand would be 3, roughly half of the time, and that demands of 1 and 5 would be rare. One might subjectively set $P(3) = .5$, $P(2) = P(4) = .24$, and $P(1) = P(5) = .01$.

Groping in the manner illustrated would produce serious inaccuracies. But no inventory analysis can be sharp in the face of meager knowledge of demand and lead time. In most cases, one has enough information to justify one of the analytic models introduced below.

V. NORMALLY DISTRIBUTED LEAD TIME DEMAND

In our first analytic model, it is assumed that the lead time demand is normally distributed. This assumption is unacceptable in most situations. This point would seem to require emphasis because many writers restrict the applicability of their analyses to the case of normally distributed lead time demand. But in most situations en-

TABLE 3

Normal Approximation to Demand of Table 1

d	$P'(d)$	$R'(d)$	$S'(d)$	d	$P'(d)$	$R'(d)$	$S'(d)$

83	.089	.545	2.265	95	.004	.004	.006
84	.092	.453	1.720	96	.002	.002	.002
85	.089	.364	1.267	$97-\infty$	.002		
86	.083	.281	.903				

countered by the authors, it would be extremely unfortunate to calculate under the assumption of normality. Consider, for example, the distribution of Table 1. If the usual normal approximation to the demand of Table 1 is constructed, one obtains the probability distribution of the column headed $P'(d)$ in Table 3. In addition, Table 3 contains $R'(d)$ and $S'(d)$ computed from $P'(d)$ in the same way that $R(d)$ and $S(d)$ were obtained from $P(d)$. We can see in Tables 1 and 3 that when an inventory policy involves large values of X, the expected shortage, given by $S(X)$, is more than twice the value given by $S'(X)$. If X and Y are determined from the normal approximation, if the optimum policy has X between 92 and 94, and if r is the assigned run-out fraction, the actual run-out fraction will turn out to be greater than $2r$.

The reason for the inadequacy of the normal approximation in the case of Tables 1 and 3 is that the distribution of lead time demand is skewed; the possible values of the demand extend farther above the mean than below (the mean is 84, and $96 - 84 = 12$ is greater than $84 - 77 = 7$). We say that the distribution of demand has a long right-hand tail. In real situations such tails are typical. If there are different classes of customers with different demand characteristics, one would expect the demand distribution to be skewed. Furthermore, when the lead time is uncertain, skewness is expected. For example, if both the daily demand and the lead time are normally distributed, the lead time demand will be skewed (3). Some writers consider lead time demand with a Poisson distribution, and this distribution is skewed.[1]

The theoretical basis for hoping the lead time demand to be normal is the central limit theorem. This idea is relevant, and lead time demands are approximately normal in many situations. However, as is apparent in section II, the solutions X and Y involve the values of $S(X)$ only for large demands, typically. This means that in typical cases, essentially the only part of the distribution of lead time demand that influences the solution X and Y are the values in the right-hand tail. When any approximately normal distribution is approximated by a normal distribution, the approximation is usually least accurate in the tails. Hence, it is dangerous to rely on the tendency towards normality guaranteed by the central limit theorem. The model of this section is sometimes applicable, but it should not be used blindly. However, the more accurate model of section VI employs the results to be developed for the present model, and the present section constitutes a first step in a more careful analysis.

Let $\phi(t)$ be the probability density of the standard normal distribution. Let μ and σ be the expected value and standard deviation of the lead time demand. We approximate the probability that the lead time demand is for d items by

$$\frac{1}{\sigma}\phi\left(\frac{d-\mu}{\sigma}\right).$$

We recall that $S(X)$ is 1 times the probability that the lead time demand is for $X+1$ items, plus 2 times the probability that the demand is for $X+2$, plus 3 times the probability that the demand is for $X+3$, etc. Hence,

$$\begin{aligned} S(X) &= \frac{1}{\sigma}\sum_{i=1}^{\infty} i\phi\left(\frac{X+i-\mu}{\sigma}\right) \\ &= \frac{1}{\sigma}\sum_{j=X+1}^{\infty}(j-X)\phi\left(\frac{j-\mu}{\sigma}\right) \\ &\cong \frac{1}{\sigma}\int_{X+1/2}^{\infty}(x-X)\phi\left(\frac{x-\mu}{\sigma}\right)dx \end{aligned}$$

because if $\alpha(x)$ is a function of x,

$$\alpha(a)+\alpha(a+1)+\cdots+\alpha(b-1)+\alpha(b) \cong \int_{a-1/2}^{b+1/2}\alpha(x)dx.$$

The change of variable

$$t = \frac{x-\mu}{\sigma}$$

and the notation

$$u = \frac{X+\frac{1}{2}-\mu}{\sigma} \qquad \text{Eq. 10.}$$

lead to

$$\begin{aligned} S(X) &\cong \int_u^{\infty}(\sigma t+\mu-X)\phi(t)dt \\ &= \frac{\sigma}{\sqrt{2\pi}}\int_u^{\infty} te^{-t^2/2}dt + (\mu-X)\int_u^{\infty}\phi(t)dt. \end{aligned}$$

If $\Phi(t)$ is the accumulated normal probability from $-\infty$ to t,

$$\begin{aligned} S(X) &\cong \frac{\sigma}{\sqrt{2\pi}}\left[-e^{-t^2/2}\right]_u^{\infty} + (\mu-X)\left[\Phi(\infty)-\Phi(u)\right] \\ &= \sigma\phi(u) + (\mu-X)\left[1-\Phi(u)\right] \end{aligned}$$

[1] However, the authors have never encountered a real situation in which it would be legitimate to assume the lead time demand to be Poisson. Hence, although it is possible to construct simple nomograms for the case of Poisson demand, we do not recognize their utility.

which, with the help of Eq. 10. reduces to

$$S(X) = \sigma[\phi(u) + u\Phi(u) - u] + \tfrac{1}{2}[1 - \Phi(u)]. \quad \text{Eq. 11.}$$

To illustrate the utility of this model, we return to the numerical illustration of section II. We calculate from Table 1 that the expected value of d^2 is

$$(77)^2(.01) + (78)^2(.05) + \cdots + (96)^2(.01) = 7074.78,$$

and this permits us to write, using Eq. 7.,

$$\sigma^2 = 7074.78 - (84)^2$$
$$= 18.78,$$

from which, by extracting the square root, we get

$$\sigma = 4.334. \quad \text{Eq. 12.}$$

We could now reconstruct Table 2 using Eq. 11. instead of the correct values of $S(X)$ given in Table 1. This amounts to a numerical procedure for computing the optimum X and Y when the lead time demand is assumed to be normally distributed. The calculation uses only the expected value and standard deviation of lead time demand rather than the complete distribution given in Table 1. We shall not carry out this computation because we shall obtain the result by another computation which can be called analytic rather than numerical.

In the use of the table of $S(X)$ in Table 1, we must restrict X to be integral. However, Eq. 11. permits X to vary continuously. This fact permits the following mathematical analysis. We return to $C(X)$ as given in Eq. 6., and we now assume that $S(X)$ in this formula is given by Eq. 11. We compute the derivative of $C(X)$ with respect to X to be

$$C'(X) = -\frac{rDC_o}{[S(X)]^2} S'(X) + C_i\left[1 + \frac{1+r}{2r} S'(X)\right]. \quad \text{Eq. 13.}$$

Our objective is to determine the minimum $C(X)$ by equating $C'(X)$ to zero and solving for X. However, we introduce

$$f(X) = \frac{[S(X)]^2 C'(X)}{C_i}. \quad \text{Eq. 14.}$$

We shall solve the equation

$$f(X) = 0.$$

We see in Eq. 14. that the root of this last equation will be the root of $C'(X) = 0$. The function $f(X)$ is introduced because $f(X) = 0$ is easier to handle than $C'(X) = 0$. From Eq. 13. and Eq. 14., we obtain

$$f(X) = \frac{rDC_o}{C_i} S'(X) + [S(X)]^2\left[1 + \frac{1+r}{2r} S'(X)\right]. \quad \text{Eq. 15.}$$

To solve $f(X) = 0$ by Newton's method, we require

$$f'(X) = -\frac{rDC_o}{C_i} S''(X) + 2S(X)S'(X)\left[1 + \frac{1+r}{2r} S'(X)\right] + \frac{1+r}{2r}[S(X)]^2 S''(X). \quad \text{Eq. 16.}$$

This expression requires the derivatives of $S(X)$. We calculate from Eq. 10. and Eq. 11. that

$$S'(X) = \frac{dS(X)}{du}\frac{du}{dX}$$
$$= \phi'(u) + \Phi(u) + u\Phi'(u) - 1 - \frac{1}{2\sigma}\Phi'(u).$$

We recall that $\Phi'(u) = \phi(u)$ because the derivative of the accumulated probability function is the probability density. Also,

$$\phi'(u) = \frac{d}{du}\frac{1}{\sqrt{2\pi}}\exp(-u^2/2)$$
$$= -u\phi(u).$$

Hence,

$$S'(X) = \Phi(u) - 1 - \frac{1}{2\sigma}\phi(u). \quad \text{Eq. 17.}$$

Similarly, we obtain

$$S''(X) = \left[\phi(u) + \frac{1}{2\sigma} u\phi(u)\right]\frac{1}{\sigma}$$
$$= \left(\frac{1}{\sigma} + \frac{u}{2\sigma^2}\right)\phi(u).$$

We have enough formulas to solve $f(X) = 0$, and hence, $C'(X) = 0$, by Newton's method. To illustrate, we return to the example of section II. We have $p = \frac{1}{2}$, $r = .01$, $D = 4$, $C_o = \$5$, $C_i = \$2/365$, and from Eq. 7. and Eq. 12. we have $\mu = 84$, $\sigma = 4.334$. To solve $f(X) = 0$ we need a trial value of X. A good procedure is to use the results of section III to approximate the optimum X. This gives the trial value $X = 86.7$ obtained from Eq. 9. It will be convenient to convert to u by Eq. 10.; we obtain the trial value of u to be

$$u = \frac{86.7 + \frac{1}{2} - 84}{4.334}$$
$$= .7383.$$

We need $S(X)$, $S'(X)$, and $S''(X)$. From Eq. 11. and tables of the normal probability functions, we obtain for the trial value of u

$$S(X) = 4.334[.3038 + .7383(.7698) - .7383] + \tfrac{1}{2}(1 - .7698)$$
$$= .6952.$$

We calculate, using Eq. 17. and Eq. 18. that

$$S'(X) = .7698 - 1 - \frac{.3038}{8.668}$$
$$= -.2652,$$
$$S''(X) = \left(\frac{1}{4.334} + \frac{.7383}{2(4.334)^2}\right)(.3038)$$
$$= .07607.$$

Using Eq. 15., we calculate that

$$f(X) = -\frac{(.01)(4)(5)}{2/365}(-.2652)$$
$$+ (.6952)^2\left[1 + \frac{1.01}{.02}(-.2652)\right]$$
$$= 3.690.$$

Similarly, from Eq. 16. we obtain

$$f'(X) = 3.650.$$

Newton's method adjusts the trial value $X = 86.7$ to obtain

$$X - \frac{f(X)}{f'(X)}$$
$$= 86.7 - \frac{3.690}{3.650}$$
$$= 85.7.$$

To obtain the root of $f(X) = 0$ with greater accuracy, the calculations are repeated with the new trial value $X = 85.7$ in place of $X = 86.7$.

Suppose we accept $X = 85.7$, round off, and approximate the optimum X by

$$X = 86. \qquad \text{Eq. 19.}$$

To obtain Y we use Eq. 5., Eq. 10., and Eq. 11., obtaining,

$$Y = \frac{1 - .01 + .005}{.01} S(86)$$
$$= 99.5(.9000)$$
$$= 90. \qquad \text{Eq. 20.}$$

The solution is complete. We can see the error resulting from the normal approximation. We substitute Eq. 19. and Eq. 20. in Eq. 4. using the correct value of $S(X)$ given in Table 1. We find that the run-out percentage is 1.16 percent rather than the 1 percent desired. We can see by comparing Tables 1 and 3 that for values of X near the optimum value $X = 87$, $S'(X)$ in Table 3 underestimates the correct $S(X)$ given in Table 1 by roughly 20 percent. This indicates why the policy Eq. 19. and Eq. 20. produces a run-out percentage 16 percent greater than desired. If, for the demand of Table 1, we had used costs and a run-out fraction which led to an optimum policy with X less than 83, the normal approximation would have given an approximate solution with a run-out percentage less than assigned. This is due to the fact that when d is less than 83, $S'(d) > S(d)$. If the optimum policy had X equal to 83 or 84, the normal approximation would have practically no error. If we keep the same conditions of the illustrative problem except that we let r decrease below 1 percent, the relative error in the normal approximation would increase with r (until X became greater than 95).

The accuracy of the normal approximation depends upon how closely the distribution of lead time demand can be approximated by a normal distribution. In some real problems, the normal approximation is better than in the case of our artificial example, but, in many cases, the approximation is much worse. In some situations, it is wise to estimate X and Y two ways, once using the normal approximation and once the more accurate model of section VI. If the two results are practically the same in several instances, one might be led to assume that the demand is approximately normal.

The present analysis can be applied to a situation in which knowledge of the distribution of lead time demand is meager. To illustrate, suppose that there is not enough experience to permit the construction of a table like Table 1. It is felt that the lead time demand should average roughly 100 items. During a specific lead time the demand might occasionally be as low as 75 or as high as 125. It is even possible that in some rare situations the demand may lie outside the interval 75-125. However, it is inconceivable that the demand could be less than 50 or greater than 150. With such limited knowledge, one could assume that the expected lead time demand is $\mu = 100$. Furthermore, the range could be estimated by $150 - 50 = 100$. The assumption that the lead time demand is roughly normal leads one to estimate the standard deviation by one-sixth of the range.[2] Hence, one would use $\sigma = 100/6 = 16.7$. This is all that is required for use of the analysis of this section.

VI. SKEWED LEAD TIME DEMAND

We shall sharpen the analysis of section V in which the assumption of a normally distributed lead time demand led to inaccurate results. The reason for this inaccuracy has been discussed, and we have seen that in the numerical illustration the right-hand tail of the normal distribution does not extend far enough to the right. Furthermore, as we consider the calculations involved in the earlier sections of this paper, we recognize that in many situations it will be only the right-hand tail of the distribution of lead time demand that is used in the computations. Specifically, we shall use $S(X)$ for large values of X only.

These observations lead to the conclusion that we need a model of demand during lead time which accurately

[2] In many situations, a statistician can suggest other estimating procedures for the standard deviation.

approximates the right-hand tail of the distribution. The model can be inaccurate elsewhere. In this light, the authors have introduced the following procedure (3). Let us continue to speak in terms of the numerical illustration. In section V we used the normal approximation with expected value $\mu = 84$ and standard deviation $\sigma = 4.334$. Let us consider a normal distribution with expected value still 84, but whose standard deviation is $k\sigma = 4.334k$ with k a little greater than 1. The tail of this new distribution will extend farther to the right. We might hope that with a judicious choice of k, the new distribution would fit the empirical data in the right-hand tail. In (3), the authors have developed a method for selecting k. We shall not repeat that analysis here. But reference to the earlier paper leads to the choice of

$$k = 1.17.$$

Hence, we consider the normal distribution with $\mu = 84$, and standard deviation

$$\sigma = 4.334(1.17)$$
$$= 5.071.$$

The normal approximation to the distribution of lead time demand with $\mu = 84$ and $\sigma = 5.071$ is given in

TABLE 4

Normal Approximation with Augmented Standard Deviation

d	$P''(d)$	d	$P''(d)$	d	$P''(d)$
0–76	.070	84	.078	91	.030
77	.030	85	.077	92	.023
78	.039	86	.073	93	.016
79	.048	87	.066	94	.012
80	.058	88	.058	95	.007
81	.066	89	.048	96	.005
82	.073	90	.039	97 – ∞	.007
83	.077				

Table 4. Comparison with Tables 1 and 3 shows that the approximation of Table 4 is much better in the right-hand tail than the approximation of Table 3. The fact that the distribution of Table 4 is much worse in the left-hand tail is of no concern.

If the analysis of section V is repeated with $\sigma = 5.071$, rather than 4.334, we approximate the optimum policy by

$$X = 87,$$
$$Y = 85.$$

This policy produces an expected run-out of 0.925 percent. This run-out percentage is too low with a relative error of 7.5 percent. This result should be compared with the solution of section V in which the run-out percentage is too high with a relative error of 16 percent.

We shall not repeat in this article the analysis of (3) which leads to the value $k = 1.17$. However, we shall outline the nature of the analysis. The skewness of the lead time demand is computed as the third central moment divided by the cube of the standard deviation. This skewness brings to light the long right-hand tail. Then (3) considers the problem of fitting the lead time demand with a Gram-Charlier series consisting of two non-zero terms determined by the expected value, the variance, and the skewness. A normal fit to the right-hand tail of this Gram-Charlier series is determined through the introduction of $k\sigma$ as used in this article.

VII. A GENERAL CASE

Many inventory problems are in the following form and can be handled in the following manner. The expected value, standard deviation, and third moment of the daily demand can be estimated from experience. Also, the expected value, standard deviation, and skewness of the lead time can be estimated from experience. From these parameters, one can estimate the expected value, standard deviation, and third moment of the lead time demand by the method of (3). The multiplier, k, employed in section VI, can be determined by the method of (3). Then one can approximate the optimum inventory policy as was done in sections V and VI.

VIII. THE CASE OF LARGE RUN-OUT

We have estimated the average stock level to be the arithmetic mean of the expected high and low levels. However, if run-out fraction is large, this is inaccurate. If, say, the run-out fraction is 10 percent, the stock level will be non-zero, roughly 90 percent of the time. One is led to replace $C_2(X, Y)$ in section II by $.9C_2(X, Y)$.

IX. VARIABLE CUSTOMER ORDER SIZE

It has been assumed that each customer order is for a single item. Suppose that the number of items in a single customer order has the expected value E, the variance V, and the third central moment μ_3. A "critical" order reduces the stock level from a value greater than X to a value less than or equal to X. Let x be X less the stock level after the critical order is filled (we ignore the possibility that an order be greater than the stock level when that level exceeds X). We must add the expected value $E(x)$ and variance $V(x)$ of x to the expected value and variance of the lead time demand. We have

$$E(x) = \frac{V}{2E} + \frac{E}{2},$$

$$V(x) = \frac{\mu_3}{3E} + \frac{V}{2} + \frac{E^2}{12} - \frac{V^2}{4E^2}.$$

To indicate the derivation of these results, we let $P(s)$ be the probability density of customer order sizes. We assume that the probability density of the size t of the critical order is $tP(t)/E$. We assume that the conditional probability density of x, given t, is $1/t$. Then the joint probability density of t and x is $P(t)/E$. From this density function, the expected value and variance of x are derived by standard computations. These derivations are omitted because they require techniques of mathematical statistics which we do not wish to assume on the part of the reader.

An Analytic Solution to the Least Cost Testing Sequence Problem[1]

by **L. G. MITTEN**

Department of Industrial Engineering, The Technological Institute, Northwestern University

IN (1) PRICE describes the "least cost testing sequence" problem. The problem may be briefly stated as follows:

An item is to be subjected to n different tests—say tests a (length), b (hardness), c (diameter), $\cdots$. Associated with the j^{th} test are two constants—C_j, the cost per item of conducting the j^{th} test, and R_j the probability of rejecting the item on the j^{th} test. The tests are independent in the sense that they may be run in any order whatsoever; the constants C_j and R_j are taken to be independent of the order in which the tests are run. For some particular choice for the sequence of tests, say $\boldsymbol{S} = \{a, b, \cdots, p\}$, the rule is established that an item is subjected to each test in the sequence in turn as long as the tests accept the item; if the item is rejected by a test, no further tests in the sequence are performed. An expected cost criterion function is proposed and has the form[2]

$$C(\boldsymbol{S}) = \sum_{j \in \boldsymbol{S}} C_j \prod_{i<j} (1 - R_i) \qquad \text{Eq. 1.}$$

Price proposes that the sequence which minimizes $C(\boldsymbol{S})$ be found by total enumeration of the $n!$ possible test sequences. As will be seen, the problem has an extremely simple analytic solution.

ANALYTIC SOLUTION

The following procedure yields the least cost testing sequence:

1. For each test j, compute the ratio C_j/R_j;
2. Run the test with the smallest value for the above ratio first, the one with the second smallest ratio second, $\cdots$, and the test with the largest ratio last.

As an illustrative example, we use the data given by Price in (1).

Test	R_j	C_j	C_j/R_j	Optimal Order of Tests
Visual	.002	.08	40	5
Shock	.05	.584	11.68	4
Electrical	.05	.232	4.64	3
Distortion	.035	.124	3.54	2
Vibration	.65	.64	.985	1

PROOF

Let $\boldsymbol{S} = \{a, b, \cdots, i, j, \cdots, p\}$ be any test sequence different from a sequence given by the foregoing procedure. In particular assume $C_i/R_i > C_j/R_j$ (such tests i and j must exist or the sequence $\boldsymbol{S}$ will be identical with a sequence given by the foregoing procedure). Now consider the sequence $\boldsymbol{S}' = \{a, b, \cdots, j, i, \cdots, p\}$ obtained from $\boldsymbol{S}$ by transposing the order of tests i and j. Then it follows directly that[3]

$$\begin{aligned} C(\boldsymbol{S}) - (\boldsymbol{CS}') &= \left[C_i \prod_{r<i} (1 - R_r) + C_j(1 - R_i) \prod_{r<i} (1 - R_r) \right] \\ &\quad - \left[C_j \prod_{r<i} (1 - R_r) + C_i(1 - R_j) \prod_{r<i} (1 - R_r) \right] \\ &= \left[\prod_{r<i} (1 - R_r) \right] (C_i R_j - C_j R_i) \qquad \text{Eq. 2.} \end{aligned}$$

But

$$\prod_{r<i} (1 - R_r) > 0$$

(except in the trivial case where some $R_r = 1$) and $C_i R_j - C_j R_i > 0$ (since $C_i/R_i > C_j/R_j$ by hypothesis). Therefore, $C(\boldsymbol{S}) > C(\boldsymbol{S}')$. By a series of transpositions of adjacent elements (each adjacent pair having the properties of tests i and j in $\boldsymbol{S}$) we may finally obtain a sequence given by the procedure of the preceding section. Since each such transposition yields a smaller expected cost, the final sequence is optimal.

[1] *Editor's Note:* Several readers have submitted material similar to the above, including Spencer B. Smith (Raytheon Manufacturing Company), Morton Klein (Columbia University), R. E. Beckwith and B. B. Winter (Aeronutronic, A Division of Ford Motor Company), and others. The Mitten material has been accepted for publication due to receipt priority. It should be mentioned that other investigators have also published material similar to the above, including J. Sacks (Columbia University) and S. M. Johnson (The Rand Corporation).

[2] The notation $i < j$ means "i precedes j in the given sequence S," with $\prod_{i<j}(1 - R_i) \equiv 1$ if j is the first element of S.

[3] We take $r < i$ to mean "r precedes i in $\boldsymbol{S}$."

On Obtaining Consistency in Application of Predetermined Time Systems

by CLARENCE W. FREDERICK

Chief Industrial Engineer, Molded Case Circuit Breaker Division, Square D Company

HISTORICALLY, many systems and procedures have been designed to promote consistency in rating and stop-watch techniques. These systems and procedures were established in an attempt to achieve more accurate and consistent labor standards.

The introduction of predetermined time systems, such as Work Factor, Methods-Time-Measurement, etc., may have mistakenly tended to negate or minimize the importance of discovering new, or using established, ways to obtain greater consistency in time standards. It has, perhaps, been presumed that consistency in labor standards is being achieved automatically by the use of a predetermined system.

REASONS FOR INCONSISTENT STANDARDS

Inconsistency in newly established labor standards, even by the use of a predetermined time system, can be caused by a number of reasons. Some of these are:

1. Inexperience of the analyst.
2. The tendency to stray or vary from the motion and classification theories as conceived by the designers of the system being used.
3. Errors or faulty interpretations in application of the motion classifications, such as positions, apply pressures, assembly tables, etc.
4. Attempts to interpret motion classifications in the light of the production that the analyst expects the particular operator to achieve.

In addition, it is still as true with predetermined time systems, as it has been with stop-watch methods, that a major contribution to inconsistent standards is the human inability to determine, in an absolute sense, the "one best method." To illustrate this point, a group of engineers can be assigned the task of independently determining the "one best method" to be used for a selected job. It is almost a foregone conclusion that all of the engineers will not submit the same solution. Similarly, inadequate or erroneous statistical studies of non-cyclical elements and cyclical occurrences will tend to reduce the accuracy of the standard being established. This type of data plays a very important and integral part in the establishment of the labor standard.

WEEKLY MEETINGS

At the Square D Company, it has been found that a series of weekly meetings, held to discuss the theory and application of the predetermined time system used, showed the greatest promise of promoting consistent labor standards. In fact, it is felt that the success of the program for better time standards stemmed principally from the results obtained from these meetings. These meetings are held for two hours each week. Because of the importance of the work it is not expected that the series of meetings will be terminated at any future date and are, therefore, conducted on a continuing basis.

The general areas of study include a detailed review of the theory of the predetermined time system, definitions, and practical examples for study and practice (laboratory sessions). Day-to-day operating problems, other than those involved in the theory and application of the predetermined time system, have no place in a meeting of this kind and are therefore not considered for discussion. We felt that an extended discussion of the theory of each motion classification and a detailed examination of definitions were essential at the outset to form a basis for the work that followed. As a result, the first 25 or so meetings were spent in these areas of study. (The extent of the discussion of theory is somewhat dependent upon the previous knowledge and experience of the practitioners in the class.)

From this foundation, the next activity of the group was concerned with application of the theory just studied. Each participant was expected to bring to the meeting a timestudy completed during the previous week on a selected operation or job in the shop. He was expected to be ready to defend his results as well as discuss his reasons for assigning the particular motion classifications that were used.

This review and discussion of the examples, together with reasons for establishing particular motion classifications, did more to further the learning process than any other means used to date. In addition, a mathematical measure of the effectivenesss of the previous sessions on theory could be established by measuring the dispersion found in the group of time standards established independently by each member of the class. This measure was computed in percent of the expected or "true" standard.

It was soon discovered, however, that the procedure of requiring each member of the group to establish a standard on the same operation in the factory was not adequate. Too many times the discussion and review were

directed toward variations in opinions about the "one best method" and not about the study of theory and application of the predetermined time system. In addition, the dispersion computed to determine the progress of the class was being inflated by these differences in method.

USE OF FILMED EXAMPLES

Henceforth, factory operations that were to be used for practice studies were selected and then photographed using 16mm film. The film was then presented to the group and each member individually established a time standard in class for the method being presented. Distances, tolerances, etc., and other necessary data were made available to the group since these facts could not readily be determined by observation of the movie.

The use of film tended to reduce discussions about the differences in methods and allowed a more accurate determination of the differences between the studies of various engineers since the methods studied were now the same. In addition, this technique allowed the instructor to easily select examples which showed particular motions that the group had been studying and with which the group was having trouble.

At least one session per month is now being devoted to a review of the theory of particular motion classifications. The need for these review sessions is determined from the discussions of the practice studies of the previous weeks or from the day-to-day problems that might arise. In addition, the need is also dependent upon the extent of change of the participants due to advancement, reassignment, additions, separations, and upon the length of time elapsed since the last study of these classifications.

ADDITIONAL ADVANTAGES

These meetings have also produced other important side effects. For example, changes in procedures have been occasionally recommended. The use of a separate job instruction sheet was eliminated and the Motion Summary Sheet was substituted. The job instruction sheet was formerly used for the purpose of describing the method of operation to be used by the operator. The latter form was used only to summarize the various study elements required for the establishment of a particular time standard. Now, with proper added notations, it serves both purposes.

Also, a listing of particular motion classifications to be used whenever certain motions, or a series of motions, occur was compiled. For example, by reference to the list, the movement of the hand to a hopper of parts will now be assigned the same motion classification by all engineers.

CLOSE SUPERVISION

In addition to the formal training and practice just described, it was considered essential that each standards engineer be closely supervised for an extended period of time. In the writer's opinion, it is doubtful that one can closely supervise the work of more than five engineers and still have consistent and uniform time standards in a plant using a predetermined time system.

Each study is being given careful scrutiny by the Standards Supervisor to insure conformance to the established practices of the predetermined time system. The review also includes an examination of the methods used to obtain the necessary frequency data, a check of the mathematics of the study, and an analysis of its application to the particular operation being studied. After each engineer has proven his competency in the application of the predetermined time system, the supervisor will only spot check his work.

STANDARD DATA

This paper would not be complete without recognizing older established methods of obtaining consistent labor standards. One of the most important of these is, of course, the use of standard data. Standard data can be defined as the technique of grouping, graphing, classifying, etc., elements of similar operations in such a way that a "family" of time standards can be determined. This family of standards is established in relation to a set of variables that are inherent in the operation being studied, such as length or width of the parts, distances, etc. In this way, very few individual studies need to be made for the total series of operations.

Another advantage is that consistency between the various similar operations is achieved since the time values used were applied from only one, or a few studies. However, it will also be admitted that inaccuracy may still be a problem since an error introduced in the original study or studies would be applied to all of the operations to which the particular data were applied.

CONCLUSION

The combination of close supervision and the regular study and practice of the predetermined time system should result in the establishment of better and more uniform time standards. The added expense of these procedures is nominal but will be far outweighed by the resultant advantages of consistent earnings and employee acceptance.

BANNERS FOR SENIOR AND STUDENT CHAPTERS

Cost $75.00

4 x 8 ft., blue and gold felt, with a blue, gold and white embroidered AIIE insignia in the center

Available from: AIIE Headquarters
145 North High Street
Columbus 15, Ohio

(Allow about six weeks for manufacture and delivery)

THE AMERICAN INSTITUTE OF INDUSTRIAL ENGINEERS

WILL HOLD ITS

ELEVENTH ANNUAL NATIONAL CONFERENCE AND CONVENTION

ON

THURSDAY, FRIDAY AND SATURDAY—MAY 12, 13, 14, 1960

AT

SHERATON-DALLAS—DALLAS, TEXAS

THE SIXTIES

A CHALLENGE TO INDUSTRIAL ENGINEERING

The decade of the Sixties is a Challenge to Industrial Engineering. Our accelerating progress should stimulate new ideas, new techniques, and new research.

The Industrial Engineer must be alert to the challenge. He must be alive to the trends in the mathematical, physical, and social sciences. He must realize that only through the interchange of knowledge can the individual continue to exhibit professional competence.

To this purpose is dedicated the 11th Annual AIIE Conference. The presentations at all technical sessions will be given by authorities in the field. This will be your opportunity to obtain the latest information about Management Controls, Operations Research, Automation, Standard Practices, Industrial Relations, and Information Processing.

SCHEDULE OF FEES

	Member	*Non-Member*
Full Conference All sessions on Thursday and Friday, two luncheons, one banquet and Proceedings.	$47.50	$57.50
Thursday Only All sessions on Thursday and luncheon.	$23.50	$29.00
Thursday Luncheon Only	$ 6.50	$ 8.00
Friday Only All sessions on Friday and luncheon.	$24.50	$31.00
Friday Luncheon Only	$ 7.50	$ 9.50
Banquet Only (Thursday Night)	$11.00	$14.00
Saturday Convention Luncheon	$ 6.00	$ 6.00
Saturday Convention (Members Only)	Free	Free
Conference Proceedings	$ 5.50	$ 7.50
Undergraduate Students, High School Teachers, and Vocational Guidance Counsellors—Session Only	$ 2.75	
Ladies Program	$21.50	$21.50
Friday Evening—Texas Style Rodeo Including Barbecue and Catfish Fry	$ 7.50	$ 7.50

NOTES:

1. For a detailed announcement or registration write to: AIIE, P.O. Box 914, Irving, Texas. Checks are to be made payable to: "Eleventh National AIIE Conference."
2. Refunds for cancelled reservations will be made only if notice is received prior to May 10, 1960.

president's message

FRANK J. JOHNSON

President, American Institute of Industrial Engineers, Inc.

1959-60

Long Range Planning

INTELLIGENT action based upon sound decisions is dependent upon the collection and keen analysis of all the facts pertaining to a particular problem. Many of these facts are the result of a look into the "crystal ball" of the future as interpreted by our Long Range Planning Committee, the organization charged with the responsibility of anticipating future problems and taking the necessary action to do something about it.

The Long Range Planning Committee was hatched in a smoke filled hotel room late one night in early 1955 by Don Malcolm, present Chairman of the Committee, and Chuck Lake, then Director of Industrial Engineering at R. R. Donnelley in Chicago. They both felt that something needed to be done to lift the standards of the profession, to get at the functions of Industrial Engineering, to define the term "Industrial Engineering," and to generally raise the standards of the profession. This concern led them to invite a number of leaders in the Industrial Engineering profession to a short meeting held during the national convention in St. Louis in May of 1955. At this meeting a number of opinions were voiced on the problems facing the Industrial Engineering profession and suggested remedies for these problems. The following specific suggestions did come out of this meeting:

1. The AIIE should develop a definition of Industrial Engineering consistent with the definition of Engineering.
2. This group should meet again for two days in the Fall of that year at Cornell to explore the subject further.

Thus was born the first of the Industrial Engineering Symposia, which have been the primary contribution of the Long Range Planning Committee over the past five years. The Cornell Symposium developed the definition of Industrial Engineering which was later adopted by the AIIE as its official definition. This definition has since been widely published and quoted and is one of the best known definitions in the entire Engineering field.

The success of the Cornell Symposium led to the subsequent holding of a Symposium each fall on the campus of a leading university. The outputs of these Symposia are summarized below:

1. *Purdue Symposium*—The group was primarily concerned with communicating an understanding of the Industrial Engineering definition developed the year before. As a result, four expository paragraphs were developed, each one aimed at explaining what an Industrial Engineer is and what he does. Each of the four paragraphs were written in terms which would mean most to people in the following groups—management, employees in industry, engineers and other staff groups, and the general public.
2. *Georgia Tech Symposium*—A question had been raised concerning the meaning of "system" and "systems design" as understood and used in the formal definition of Industrial Engineering. As a result of this, the Georgia Tech Symposium was concerned with further defining Industrial Engineering by the presentation of case studies that would particularly depict the dynamics of systems design. These case histories were intended to illustrate the design process in Industrial Engineering, the growing attention to systems problems, the relationship of Industrial Engineering to other branches of Engineering, how Industrial Engineering must be co-ordinated with other staff activities, and how it operates as an internal consulting function. The case histories were entitled: A Study of an Airlines Reservations System (Warren Alberts, United Airlines), Design of a Synthetic Detergent Production and Distribution System (Richard Forberg, Procter & Gamble), The Mechanization of a Fin-

ishing Operation (George Gustat, Eastman Kodak), and Organization for Systems Design (L. T. Ohmart, Armstrong Cork Company).

3. *Iowa Symposium*—The results of this Symposium were a flow-chart illustrating the Industrial Engineering process, a statement of the key areas where the profession can make its greatest contribution, and a statement of the tools and techniques used in the Industrial Engineering process.

The Northwestern Symposium has just recently been completed. This Symposium followed a somewhat different pattern this year from Symposia of previous years. Alex Rathe and Hal Davidson, respectively, led excellent discussions on—

"The Relation of Industrial Engineering in Management" and "The Requisite Skills of the Industrial Engineer."

However, after the first day the group felt it was plowing old ground in these discussions . . . that there was a more or less general agreement on what the composite modern Industrial Engineer is and what Industrial Engineering can do for management. What they felt lacking was any significant progress in getting the real message of Industrial Engineering, what it can do and what are its current successful applications as a function, over to the management world.

In short, it was felt that the *Image* of Industrial Engineering, as a profession and particularly as an organizational function, is very much in need of improvement. To say that this is a public relations job is one way of looking at it, and perhaps an accurate one, if one includes all of the institutional options that should be vigorously exploited in delivering the Industrial Engineering message. The group felt that Industrial Engineering, as a growing thriving function, is in danger unless a positive, comprehensive public relations program is developed. Perhaps the problem can best be brought out by stating two questions that were raised:

1. How long has it been since you have picked up a magazine like *Harvard Business Review, Business Week, Fortune,* or any other magazines that management reads and have found an article on "How Company X Uses Industrial Engineering," or "Industrial Engineering is contributing to the success of our company by being given these management missions to perform?"
2. How many companies have set up Industrial Engineering departments along the lines of United Air Lines or Procter and Gamble? If such functions aren't being created regularly, the message of their success isn't having an impact, at least not one identified as Industrial Engineering. The problem of growth-or-die may well face Industrial Engineering in this area of being "designers" of systems for management. Without proper "channel" time in management's attention span, we may lose out to more communicative professions.

It is realized that the problems are being stated quite vigorously, and I am ignoring many of the fine achievements that have been made. However, I am certain you will bear with the group in their role of focusing on problems—not dwelling on successes. The Symposia can best serve AIIE by such frank, hair-letting-down, evaluative sessions.

THE IMAGE AT THE ACADEMIC LEVEL

The group further felt that the Image of the Industrial Engineer at the academic level is excellent. The progress which has been made in designing curricula that prepare the Industrial Engineer for the kind of problems he will encounter 10 to 15 years after graduation is most satisfactory. There is no real problem here. Rather, a problem will exist in providing satisfactory job opportunities for the graduates of these schools.

THE IMAGE AS DEVELOPED IN THE *JOURNAL*

The *Journal,* in its editorial policy and content, is making Industrial Engineering acceptable in the modern technical engineering world. However, again here it appears that we are not publishing articles that can be used to influence management—our primary customer. It was felt that our current policy is necessary to insure the technical quality and professional gains that have been made. This policy should be continued. Perhaps what is needed is another periodical slanted towards management. In this regard, a proposition by a new publisher was reviewed. Bob Lehrer will have more to say in this regard.

THE IMAGE CREATED BY AIIE PROFESSIONAL RELATIONS PROGRAM

Our program in Professional Relations is exemplary—we are now a respected *working* member of the Engineering family. Little more needs to be said in this regard except to reinforce the thought that a program in Public Relations, directed toward getting our image properly conveyed to the Management World, that is as successful as our Professional Relations program, is urgently needed.

The Symposium drafted a resolution and some recommendations to AIIE for its consideration for focusing its management efforts. This resolution is still in the first draft as reported to me by Chairman Don Malcolm; and even though it will be further polished up, I felt it was of such timeliness and significance that it should be quoted here.

The Northwestern Symposium on Industrial Engineering expressed concern over the Image of Industrial Engineering, both as a profession and particularly as an organizational function, in the minds of Industrial Engineers, other Engineers and particularly in Management. Past Symposia have recognized and reported on the concept of the "Modern Industrial Engineer" as the designer of "systems" for management and have outlined opportunities for the "emerging role of Industrial Engineering."

It is the opinion of the Northwestern Symposium that this Image, or *any* image, is not being communicated adequately to the management world in particular. This problem is of sufficient importance that a program of necessary and comprehensive scope be developed and promulgated as quickly as possible. This program should be of a long range and continuing nature, directed toward creating an awareness and understanding of the modern Industrial Engineering Function. The following specific recommendations are offered as guide lines in structuring the program.

These are broken down roughly into Public Relations and Professional Development items.

Public Relations

1. Definitive articles (case histories) describing the successes of Industrial Engineering in companies should be developed and placed in leading management periodicals such as *Harvard Business Review, Fortune, Business Week,* etc. Articles by presidents and vice presidents of such companies as Argus, United Air Lines, Kodak, Procter and Gamble, International Minerals, etc., are illustrative of what is meant.
2. Study the desirability of having a 50th Anniversary celebration of the Amos Tuck Conference on Management or Gantt's 100th birthday in 1961 as a means of showing the modern Industrial Engineer. If desirable, an early start is needed to build an effective program.
3. More national control of the *content* of national convention programs. This should take the form of specific delegation of authority and responsibility to appropriate national officer or employee.
4. The possibility of two annual national meetings should be explored. AIIE has not had a national meeting in or around Chicago or New York in four years.
5. New Industrial Engineering publications directed in part toward the management world should be initiated. There are many forms this can take. The Editor of the *Journal* should develop plans in this direction.
6. The AIIE executive secretary can be quite influential in regard to an effective public relations program. He should be aware of public relations methods and experienced in how to develop effective programs.
7. A study group should be set up to explore the criteria for defining the proper (and AIIE recommended) use of Industrial Engineering as an organizational function. This is a very difficult subject to explore. Encouragement of the proper use of the term organizationally will enhance the image. The group felt that AIIE should direct its attention toward the developing, identifying and promoting of Industrial Engineering in terms of the individual professional engineer. In the long run, Industrial Engineering depends upon successful *individual Industrial Engineers* for its success.

Professional Development

1. Develop programs illustrating the professional Industrial Engineer at the chapter level. Develop workshops for Chief Industrial Engineers; build on their strength.
2. Focus attention on the individual as a problem-solver for management problems in the planning, review and control areas of management.
3. Bring the work of other professions in the management area to the professional attention of Industrial Engineers.

From the above resolution it is evident that the Symposium was concerned about the urgency of the public relation's problem. This concern will result in activity by the Board of Trustees in an effort to solve the problem.

It is hoped that from this brief description of the most recent Symposium it has been possible to obtain some insight to the operations and importance of this vital part of our Institute.

How to get new ideas on Materials Handling and Packaging

These dynamic fields change so fast that new ideas are often out of date before they get into print. Yet, if your firm is to stay competitive, you must be aware of the latest concepts.

One realistic way to keep abreast is to participate in the Industrial Management Center's 2-week courses in Materials Handling and Packaging. These work sessions provide practical training in *new* techniques, *new* methods of analysis, and in installing worthwhile cost reduction programs. Either course will revitalize your firm's efforts in that field.

These courses are effective. In 6 years, 230 men from 170 manufacturing, transportation, and retail firms in 15 countries have participated. Many send responsible top personnel every year.

Enrollment is limited. Personnel must be qualified for advanced training.

Write for 20-page brochure.

7TH ANNUAL TRAINING COURSE
JUNE 12 TO JUNE 25, 1960
LAKE PLACID CLUB
LAKE PLACID, NEW YORK

The INDUSTRIAL MANAGEMENT CENTER

James R. Bright, Director — 56-J Robbins Rd., Lexington, Mass.

Institute Interests

CALENDAR

March 24: One-day seminar will be held at the Roger Smith Hotel, Waterbury, Connecticut. This seminar will be sponsored by one of the newer chapters of AIIE, the Naugatuck Valley Chapter. The theme is "Selling Yourself and Your Ideas to Your Superiors." Write: Mr. Harold W. Hasko, United States Rubber Company, Naugatuck Footwear Plant, Naugatuck, Connecticut.

April 4-7: 1960 Nuclear Congress, The Coliseum, New York, New York. Write: Dr. Clarke Williams, Chairman of the Nuclear Engineering Department of the Brookhaven National Laboratory, Upton, New York.

April 19-21: National Conference of the Armed Forces Management Association, Biltmore Hotel, Atlanta, Georgia. Write: Armed Forces Management Association, National Headquarters, Room 3d121, The Pentagon, Washington 25, D. C.; or General Management Associates, 881 Peachtree Building, Suite 210, Atlanta 9, Georgia.

April 21-28: American Society of Tool Engineers 1960 Tool Show and Annual Convention, Artillery Armory, 15000 W. 8 Mile Road, Detroit, Michigan. (Technical Sessions—Sheraton-Cadillac Hotel, Detroit, Michigan.) Write: Harry E. Conrad, Executive Secretary ASTE, 10700 Puritan Avenue, Detroit 38, Michigan.

April 7-8: Annual Joint West Coast TIMS-ORSA Regional Meeting will be held at the U. S. Naval Postgraduate School, Monterey, California. The meeting is sponsored jointly by the Northern and Southern California Chapters of the Institute of Management Sciences and the Western Section of the Operations Research Society of America. Write: Ernest Koenigsberg, Touche, Ross, Bailey & Smart, 100 Bush Street, San Francisco 4, California.

April 25: Ninth Annual Spring Conference of the Cleveland Chapter of AIIE will be held in the new modern Cleveland Engineering and Scientific Center in Cleveland, Ohio, from 9 A.M. to 9 P.M. The Conference theme is "Are You Clued In?" For information write: Mr. C. M. Bednar, Chairman, Promotion and Publicity, Square D Company, 4500 Lee Road, Cleveland 28, Ohio.

1960 CENSUS

The 1960 Population Census will be conducted as of April 1. Every fourth household will be asked to answer the question "What kind of work was he doing?" for each person 14 years of age or older.

In order that the statistics on scientific and engineering manpower be developed as accurately as possible, the Census Bureau has asked that we pass along to our readers a reminder that this question on occupation should be answered completely and precisely. The entry should consist of at least two words in most cases.

Some examples of acceptable entries are:

Fire prevention engineer
Industrial engineer
Mechanical engineer
Motion-study engineer

CALUMET CHAPTER

A dinner meeting, September 8 at Wilson's Restaurant, Gary, Indiana, served as the "Kickoff" for the Calumet Chapter's 1959-60 business year. Speaker Jack F. Jerico, First Vice President, AIIE, spoke of "New Concepts of Industrial Engineering," with a detailed analysis of the new concepts as interpreted at college level and in industry today.

The Calumet Chapter's October Dinner meeting was hosted by George Diamond's Restaurant, Hammond, Indiana. Mr. H. C. Nickels, an investment counselor, spoke on "Investment Objectives and Securities to Meet Them." This was an informative and entertaining evening.

A special methods project undertaken by Calumet Chapter representatives was recently completed and received local appreciation and plaudits.

Involved was a small manufacturing plant conducted by Smith Memorial Industries, an outlet for the efforts of handicapped (blind primarily) people in Gary, Indiana. The industry, though small, offers employment to the blind in making such marketable items as mops, ironing board covers, small rugs, blue jeans, denim shopping bags, etc. The basic problem, as it evolved, stemmed from extremely overcrowded conditions of the shop. This was alleviated considerably by a reorganized, orderly layout, including improved storage. In this connection, one fixed and one mobile storage rack were designed and built, and two spool spindles devised to store and feed yarn and cover material onto a layout table.

Several minor innovations were integrated into the overall package of recommendations which were, incidentally, accepted by the Smith Memorial Industries supervision and the Board of Directors. As of this writing, approximately 85% of the recommended program has been installed.

As a result of AIIE study and recommendations, the Board of Directors of Smith Memorial Industries began a Calumet area promotional program to attract more customers for Smith products. This has taken the form of photographic newspaper coverage (Chicago *Sun-Times*, Gary *Post Tribune*, several local weeklies) and radio coverage (WGRY, WWCA—Gary, Indiana). In addition liaison between the Industry and various civic organizations has provided the AIIE with desirable publicity.

Upon AIIE recommendation that the Industry, as now operated, requires more space, the Board of Directors has placed on its agenda a plan to eventually underwrite expansion and/or relocation of present facilities.

Besides providing an interesting project for the AIIE members who participated, this study and recommendations were warmly received by the people served.

The Board Members and new officers of the Calumet Chapter conducted their first Fall business meeting, September 29, 1959 at Cressmoor Country Club. New officers include: President, Lew Rose, U. S. Steel, Gary; Vice President, James Freeland, U. S. Steel, National Tube Co., Gary; Treasurer, Ed Semplinski, U. S. Steel, Sheet & Tin, Gary; Corresponding Secretary, Duane Saylor, U. S. Steel, Gary; Recording Secretary, Louis Vidal, Youngstown Sheet & Tube, Indiana Harbor. The Board of Directors includes Harry McCabe, U. S. Steel National Tube Co., Gary; George Smith, Budd Co., Gary; Vern Droege, Youngstown Sheet & Tube, Indiana Harbor; Richard Fissinger, U. S. Steel, Gary; Frank Kelly, U. S. Steel, Gary; Henry Maurer, U. S. Steel, Sheet & Tin, Gary; Gerald Jones, Inland Steel, Indiana Harbor; Melvin Peterson, U. S. Steel, Sheet & Tin, Gary; Phillip Cochran, American Bridge Co., Gary.

LOUISVILLE CHAPTER

Our closing program for the preceding fiscal year was a Ladies' Night, held on May 20, and consisted of a Plant Tour of Spald-

ing Laundry and Dry Cleaning Co., Inc. This was one of the largest in attendance of all meetings last year, and was thoroughly enjoyed by all who attended.

The new business year of 1959-60 began with a chapter meeting on September 16th at the Jeffersonville Dining Room, followed by a tour of the Colgate-Palmolive Jeffersonville Plant in Indiana. A good turn-out of sixty-one members, wives, and guests found this tour most interesting, especially from the automation viewpoint.

METROPOLITAN NEW JERSEY CHAPTER

The September meeting, which was held at the Essex House in Newark, featured Henry H. Eskay, Vice President of Colmar Products Corporation, as main speaker. Mr. Eskay's talk, entitled "Crucial Problems Posed By Automation," covered the relationships between labor and management as they are affected by increased automation. Especially important was his discussion of the organizational impact of white collar automation, and the part the Industrial Engineer must play in the new technology.

Lamont M. La Robardier, Manager of Procedural and Organizational Research at Curtiss-Wright Corp., gave the program at our October meeting. His subject was "Setting Machine Time Standards for Minimum Cost." By the practical use of the minimum-cost chart Mr. La Robardier discussed an approximate or simplified method as well as an exact method to determine lowest cost cutting speeds for a given set of conditions. This new technique provides a scientific approach to the problems of cutting speed introduced by modern materials and methods. Mr. La Robardier is an active chapter member of our own Metropolitan New Jersey Chapter and a member of the Board of Governors 1957-1959.

SAVANNAH CHAPTER

The Savannah Chapter of the American Institute of Industrial Engineers has recently completed a study of the Chatham County Public Schools. This study was made at the request of the Board of Education. Its purpose was to assist the board in evaluating the nonacademic operation of the "plant" and to determine areas of improvement. Some of the major areas studied included pupil transportation, vehicle maintenance, purchasing, and custodial services.

The following is an excerpt from the letter of appreciation received by the chapter from the superintendent of education.

> "I would like to express to you . . . our appreciation for the report on investigation of school plant operation in the Chatham County Public School System. This was a service to the school system and to the public. I think it was a fine thing for the members of your Committee and for the association you represent to donate to the Board of Education the amount of time and effort required to make this study.
>
> Already, certain of the recommendations incorporated in your report have been implemented in our operation, I feel sure that this survey will continue to be of valuable assistance to us."

The First chapter meeting of the year was held in September at the Savannah Sugar Refinery. A well conducted plant tour was followed by a buffet supper and a business meeting. Many of the members had their first opportunity to view the processing of this very familiar product.

Mr. Louis Hagood of the U.S. Corps of Engineers was the guest speaker at the October meeting. Mr. Hagood's topic was the engineering problems involved in constructing underground combat centers. These centers will be used to control the defense of the North American continent in the event of air or missile attack.

SPRINGFIELD, MASSACHUSETTS, CHAPTER

The Springfield Chapter No. 94 was born last March. This event became a reality after a brief but rapid moving prelude of six months. The forming of a chapter to serve the Western part of Massachusetts was conceived by a group of Industrial Engineers, employed at Springfield Armory, Springfield, Massachusetts, who arranged an organizational meeting in October 1958.

The organizational drive, kindled by a message delivered by George H. Martin, President of the Boston Chapter, was spearheaded by Benjamin F. Ridall of Springfield Armory, interim and Charter President, and James E. Johnson, Chapman Valve Mfg. Co., interim vice president. During the winter months, the interim officers and committees kept the gears churning. Their efforts were rewarded by receiving a charter in March 1959 and by having a roster of 38 charter members.

In addition to the organizational effort, a regular monthly program was instituted under the direction of the vice president and program chairman, Jim Johnson. An excellent job was done. The November meeting was addressed by Martin Doring of Rath & Strong who spoke on "Industrial Engineering and Its Place in Industry." The December meeting was highlighted by a most interesting talk on "Value Analysis" given by Dusty Fowlkes of the General Electric Co. In January, the first dinner meeting was held and followed by an enlightening discussion on "Factors to be Considered in the Selection of In-process Materials Handling Equipment" presented by Marshall Scheider of Walworth & Co.

Mr. James Duncan, President of Work Factor Company, made the February dinner meeting a most satisfying one by speaking on "Production Planning and Inventory Control." The March dinner meeting was a full evening during which the Chapter Constitution was accepted by the membership; and George Martin, President of the Boston Chapter spoke on "The Advantages of Predetermined Time Systems." The April meeting was a joyous one. At this meeting the acceptance of our group as a Chapter of AIIE was announced, and election of officers was conducted. Our guest speaker, although congratulatory, did not share in our elation of the announcement. "Union's Attitude Towards Industrial Engineers" was the subject of Mr. Norman Eiger's talk. Mr. Eiger is Regional Educational Director of International Lady Garment Workers Union AFL-CIO, and editor of the District Union Newspaper. There was no bloodshed after his talk.

Ladies' Night, held in May, was the climax of the season's calendar. A social hour and dinner preceded the meeting. Mr. William Vallette, Vice President of Northeast Region AIIE formally presented the Chapter's charter and installed the new officers for the 1959-60 season. They were: President, James E. Johnson, Chapman Valve Mfg. Co.; Vice President, Louis Pieri, Buxton Inc.; Secretary, James E. Dowd, John Breck Inc.; Treasurer, Robert C. Bisbee, American Bosch Div., American Bosch Arma Corp. Several hours of dancing followed.

The 1959-60 season opened on Oct. 14. The high program standard established during our first season was met by having Douglas H. Anderson, Manager of Special Products Division, Exec-U-Phone Systems Inc., Boston, Mass., speak on the problems of timely and accurate data-gathering and timekeeping and describing modern techniques available for solving these problems. The November meeting was one that will be remembered for a long time by those of us who attended. This meeting was a joint meeting with the Boston Chapter held in Boston. We were host to our esteemed AIIE National President Frank J. Johnson. The programs for the remaining six meetings have been planned, and an interesting season is ahead of us.

We wish to extend our thanks to our "big brother" chapters for their welcome and assistance and to extend our welcome to our "baby brother" chapters who received their charters since March 1959.

ST. LOUIS CHAPTER

The St. Louis Chapter of the American Institute of Industrial Engineers started off the 1959-60 year with a new idea and every indication of having an extremely successful year. The first meeting was a "pre-season warm-up meeting" held on August 19th at the famous Barth Estate in St. Louis County. Approximately 50 persons attended the festivities, which included swimming, ping-pong, "old yarns" and a picnic supper on the porch.

The September meeting was the first of our dinner-speaker meetings, and we were fortunate in having Dean Don Fischer of the Washington University School of Engineering speak on "The Crisis in Engineering." Dean Fischer spoke of the abrupt downturn in engineering enrollment, which began with an 11% drop in 1958 and which will probably drop some more in 1959. He said that this downward trend is hitting the nation just when the demand for engineers is getting greater and greater each year as a result of automation and advanced technology. The drop in enrollment also has an immediate effect on the engineering schools, since the smaller tuition income results in unbalanced budgets and the cutting of necessary cost items such as laboratories. Dean Fischer said that there has been an effort made to determine the cause of the downturn, however there doesn't appear to be any one or even several reasons which can be directly pointed out as being the answer. One thing he did mention, was that engineers, and many times successful engineers in high positions, don't do enough to counter the propaganda that pours forth labeling the engineers as being "uncultured persons" in an age of humanities. Dean Fischer went on to say that he felt that culture does not come from an added number of liberal arts courses, but rather from the taking of so-called humanities courses which are geared to the needs of a group. He cited the successful engineering course of "Human Relations in Industry" as being the type of courses that are needed. It was truly an interesting meeting.

WINSTON-SALEM CHAPTER

For our April meeting, Mr. Donald S. Holmes, Logician in the Operations Research and Synthesis Section of the Large Steam Turbine Generator Department of General Electric Company at Albany, New York, spoke on "Horse Kicks and Quality Control." He covered the probability theory leading to the Poisson probability function and its use in quality control and applied statistics. Election of officers for the new year also took place at this meeting. They are: President, Clarence M. Dunlap, Jr.; Vice President, Fred T. Carter; Secretary, Milton R. Sweatman; Treasurer, Robert A. McLean. Directors for this year are: Millard W. Hodge, Hal G. Worley, Harold H. Mathews, Edgar A. Aldridge, Charles T. Johnston, and Marshall G. Bryant.

In May the Annual Ladies' Night consisting of a banquet and dance culminated the 1958-1959 season.

A meeting of Officers and Directors was held in August to approve the 1959-1960 budget and appoint committees.

YOUNGSTOWN CHAPTER

At our September meeting Mr. Renfrew, representative of IBM Corporation, gave an interesting talk on computers and their use in the Industrial Engineering and manufacturing fields. He explained the different types of computers and their varied applications. The main topic of discussion centered on the potential purchaser's inability to communicate with IBM representatives on common ground, a situation primarily due to the layman's lack of fundamental knowledge of computers.

The October meeting took the form of a "One Most Pressing Question Forum." The meeting was aimed at finding an answer to the one most pressing problem of each Industrial Engineer. Everyone wrote down his chosen question and dropped it in the fish bowl as he entered the meeting room. The chairman picked questions at random from the bowl and read each question to the group. This group therapy type of program was quite a success for different members shared their combined knowledge and practical experiences as each question arose.

BOARD OF TRUSTEES' MEETING

Biltmore Hotel
Atlanta, Georgia
Session I, Friday Evening, October 16, 1959
Session II, Saturday Morning, October 17, 1959

The Board of Trustees of AIIE is the official governing body of your organization. This group meets to conduct business for you twice a year. The official minutes of the October Board of Trustees' Meeting are published in the JOURNAL to keep you informed of AIIE activity.

The meeting was called to order by President Johnson at 8:45 P.M. October 16, 1959. Among those in attendance were: Frank J. Johnson, President; Jack F. Jericho, First Vice President; Floyd J. Titler, Executive Secretary; Ralph W. Updegraff, Treasurer; George H. Gustat, Past President; William J. Vallette, Vice President, Region I; Leroy O. Gillette, Vice President, Region II; Charles G. Howard, Vice President, Region III; John A. Nattress, Vice President, Region IV; James A. Richardson, Vice President, Region V; William N. Bryant, Vice President, Region VI; John L. Imhoff, Vice President, Region VII; Arthur E. Aronson, Vice President, Region VIII; Arthur L. Ziegelmeyer, Jr., Vice President, Region IX; Carl F. Kaiser, Vice President, Region X; Robert H. Roy, Board Member-at-Large; Warren E. Alberts, Board Member-at-Large; Alex W. Rathe, Board Member-at-Large; Howard P. Emerson, Former President; Frank F. Groseclose, Former Board Member-at-Large; Robert N. Lehrer, Editor-in-Chief, *The Journal of Industrial Engineering;* James T. French, Director of National Meetings; Henry M. Owades, Director of UEC Affairs, AIIE Professional Relations Committee; Daniel E. Mahaffey, President, Atlanta Chapter AIIE; and Don A. Trenwith, Business Administrator.

1. *Minutes, May 15, 1959 Board of Trustees' Meeting*—Mr. Gustat moved that the minutes of the May meeting be approved as presented. Motion seconded by Mr. Jericho. Motion passed.

2. OLD BUSINESS

2a. *United Engineering Center—Fund Raising Campaign*—Henry Owades, Director of UEC Affairs, reported on the progress of the campaign. The Institute had pledged approximately 71.5% of its quota. A written report was distributed. It contained two recommendations for bolstering the campaign.

1. A reinstitution of the close follow-up which the regional campaign managers (1958-59 Regional Vice Presidents) started last April.
2. A personal and close supervision of 13 specified chapters having unfulfilled pledges of $1,000.00 or more. This follow-up to be done under the coordination of the regional campaign managers, but by the respective 1959-60 Regional Vice Presidents. The Board concurred with these recommendations.

Mr. Owades listed 24 chapters that are now on the honor roll, having reached 100% of the quota assigned to them. These 24 chapters are:

Mid-Hudson	Evansville	Great Salt Lake
Rochester, N. Y.	Calumet	San Francisco-Oakland
Boston	Charleston-Huntington	Metropolitan New York
Central Connecticut	Toledo	Sacramento
York, Pennsylvania	Baton Rouge	Seattle
Nashville	Houston	Winston-Salem
Chattanooga	Oklahoma City	Lehigh Valley
Twin City	East Texas	
Mississippi Valley		

Mr. Owades listed the following chapters as having not yet submitted any report or indication that their campaign is underway:

Mohawk Valley	East Tennessee	St. Louis
Southwestern Connecticut	Memphis	Cleveland
	Middle Tennessee	Dayton
Worcester	Western North Carolina	Indianapolis
New Orleans		Stark County
Birmingham	Western Virginia	

The Board of Trustees' members will each add their own efforts when speaking to any of the chapters within the next few months. This campaign must be brought to a successful conclusion so that we may demonstrate to the other interested societies that the AIIE is contributing their share toward the UEC.

2b. *1960 Conference and Convention Report*—Mr. Updegraff reported on his correspondence with the 1960 Conference and Convention Committee regarding their proposed budget. An advance check in the amount of $400.00 has been forwarded to this committee. Mr. Updegraff has suggested some changes in their budgeting techniques and has communicated to them the instructions of the Executive Committee as passed at the September meeting.

Vice President Ziegelmeyer, as a member of the Conference and Convention Committee, reported that the entire budget was being studied and new material would be furnished to the Executive Committee prior to their November meeting.

The Executive Committee instructed Mr. James T. French, Director of National Meetings, to provide for more detail in the budgeting techniques in his proposed revision of the National Conference Manual. Mr. French was also directed to contact the Detroit Chapter (host for the 1961 conference) and instruct them to prepare a more detailed budget, following this proposed new pattern, ready for consideration by the Board of Trustees, at their May 1960 meeting.

Mr. Ziegelmeyer will arrange for a copy of the revised 1960 Conference and Convention Committee budget so that it may be reproduced by the National Headquarters office and distributed to all members of the Board of Trustees.

2c. *Journal Advertising Taskforce Report*—Dr. Lehrer, as Editor-in-Chief of the *Journal*, was asked to make a progress report to the Board on the study of the *Journal* advertising problem.

Dr. Lehrer reported that the taskforce had been staffed with Delmar W. Karger and Rogers Akers serving as co-chairmen, with Gordon Early, Jack Walker and Dr. Lehrer also serving.

This taskforce expects to have a proposal for the improvement of the *Journal* advertising available by January 1, 1960. Considerable effort has already been put into the study, but will require considerable more effort by the taskforce before a successful solution can be found.

2d. *ECPD Definition of Engineering*—Dr. Rathe reported that the proposed ECPD definition of engineering (first shown to the AIIE at the time of the May Board of Trustees' Meeting) is still under study. The Board, at that time, requested that the Long Range Planning Committee make a study of this proposed definition and send their recommendations to the Professional Relations Committee. The Professional Relations Committee has received these recommendations and is now circulating them to 29 members of the committee. After this study and a review of their recommendations by the Long Range Planning Committee, Dr. Rathe plans to submit the combined recommendations to the Board of Trustees for a mail ballot. The ballot should be ready for distribution to the members by December 1. The mail ballot will be necessary so that the final recommendations of the AIIE can be submitted to the ECPD by spring of 1960.

2e. *Unionization of Engineers*—President Johnson and Mr. Titler reviewed the background of AIIE's study of a policy that would demonstrate our position and thinking about the unionization of engineers. It was explained that the latest proposed draft of a policy statement had been submitted to Attorney Dargusch and that he made some revisions and recommended the statement which is now submitted. This draft was thoroughly discussed by the Board of Trustees.

President Johnson summarized what seemed to be the consensus of the Board and referred the recommended resolution back to the Professional Relations Committee. The Professional Relations Committee is to give further study to the several proposed statements.

To further clarify the results expected in this study, Mr. Alberts made the following motion: All files of the various proposed resolutions to be returned to the responsible taskforce of the Professional Relations Committee for consolidation to a more logical and meaningful statement of the AIIE's policy on unionization. Motion seconded by Mr. Jericho. Motion passed.

Dr. Rathe, as Chairman of the Professional Relations Committee, is to communicate to the taskforce the Board's appreciation of their efforts on this project and request that they continue their studies and carry on the work as mentioned above.

2f. *Other Old Business*

2f1. *Organization Study*—Mr. Jericho reviewed the previous proposal of the Organization Study Committee that was reviewed by the Executive Committee at their past meeting. Copies of the plan had been circulated to all the Board of Trustees' members at that time. Several suggestions for changes in the original plan had been accepted by the committee and incorporated into the report. The Board of Trustees discussed the entire plan and took the following action:

Mr. Gillette moved that the committee's recommended new organization be approved in principle, using the title of "Executive Director" instead of "Executive Vice President" for the new position to be created. Motion seconded by Dr. Rathe. Motion passed.

Mr. Jericho reported that with this action by the Board of Trustees, his committee would continue their study, and in conjunction with the Constitution Committee, make up a report on the necessary changes in the Constitution and the necessary changes in the AIIE job descriptions so that the plan might be implemented.

2f2. *Letter about Accreditation*—President Johnson read a letter referring back to previous correspondence with an engineering school regarding their request for permission to establish a student chapter. The problem involves the accreditation by ECPD in relation to (3) of Article IV, Section 3(A).

Col. Groseclose, the chairman of the committee previously asked to rule on this case, asked for clarification of category (3) saying that it was very difficult to resolve the problem without knowledge of what was meant by this provision.

To provide the committee with this information the Executive Secretary was asked to search headquarters files and to write to those individuals who originally proposed this provision which was an amendment to the Constitution.

3. NEW BUSINESS

3a. *Membership Report*—Mr. Titler reviewed the Membership Report as of October 1, 1959. The report shows at this time that there are 5,331 associate members, 2,880 members, 13 fellows, for a total of 8,244. As of this date there are 506 affiliates. On this date, there were 99 applications in the hands of the MQC. Since October 1, approximately half of these applications have been returned to National Headquarters, the remainder are in the hands of the new MQC in New Orleans. The Chairman of this new Membership Qualifications Committee is Mr. William E. Fourqurean. 165 applications were received by Headquarters during the month of September and 115 had been received at

National Headquarters during the first fifteen days of October.

3b. *New Chapter Report*—Mr. Titler reported that two chapters have been chartered since the time of the September Executive Committee Meeting. The new Senior Chapter is:

No. 101 Central Virginia Chapter, AIIE
N. H. Friedman, Vice President
P.O. Box 839
Lynchburg, Virginia

The following new Student Chapter has been chartered:

University of Minnesota Student Chapter
Douglas Norman, President
Mechanical Engineering Department
University of Minnesota
Minneapolis 14, Minnesota

Mr. Jericho stated that from his correspondence with the Vice Presidents of the Regions he has compiled a list of 34 proposed Senior Chapters in various stages of organization. Mr. Jericho was optimistic that many of these groups would be chartered during the coming few months.

Mr. Nattress, Vice President of Region IV, announced that the proposed Orlando Chapter was well underway and expected to approve their Constitution at a meeting on Tuesday, October 20.

3c. *Financial Report*—Mr. Updegraff presented the year end financial report and reviewed many of the items with the members of the Board.

Mr. Vallette moved the Treasurer's Report be accepted. Motion seconded by Dr. Rathe. Motion passed.

3d. *1959-60 Budget*—Mr. Updegraff presented the proposed budget as prepared by the Executive Secretary, Treasurer, and Chairman of the Long Range Financial Planning Committee. This proposed budget as amended by the Executive Committee at their September meeting was recommended to the Board of Trustees.

The Board discussed each item of the budget. Dr. Rathe voluntarily changed his request for expenses as a Board Member-at-Large, by reducing it $100.00. This $100.00 was subsequently added to the proposed allowance for the Vice President of Region IX.

The Board of Trustees accepted the 1959-60 budget by individual motions for each major breakdown of income and expense. The total budget for each classification, income and expense, will be $140,750.00. (Appendix 1—these minutes).

Dr. Rathe moved that with the approval of the $2,100.00 total expense allowance for the Presidential Committees, that the Board of Trustees give the Professional Relations Committee first consideration if any additional moneys become available for expenditure during the year. Motion seconded by Mr. Aronson. Motion passed.

With the approval of the budget, the meeting was recessed at 12:15 A.M. October 17th. President Johnson announced that the meeting would reconvene at 9:30 A.M. October 17 in the same room.

3e. *Engineering Management Conference*—Dr. Rathe reported that the early preliminary reports indicate this meeting was both technically and financially successful. A detailed report has been submitted to the Engineers Joint Council, but is not yet available for distribution.

Dr. Rathe moved in accordance with the recommendations of Mr. McNiece, AIIE's chief delegate to the Engineering Management Conference, that the AIIE take action to assume financial responsibility along with the other participating societies beginning in the year 1960. There was no second to the motion.

3f. *CIPM Membership*—Mr. Titler conveyed the recommendation of the Executive Committee made at the committee's September meeting recommending that the Board of Trustees take action to join the Council for International Progress in Management when the Board feels the necessary funds are available.

Dr. Lehrer and some of the members of the Board of Trustees raised questions about certain activities of the CIPM, their history, and present activities.

Mr. Alberts made a motion that the Board of Trustees take action to join the CIPM during this fiscal year. Motion seconded by Dr. Rathe. Motion did not pass.

Dr. Rathe moved that the AIIE take action to join the CIPM next October 1. Motion seconded by Mr. Vallette.

Mr. Updegraff moved that the Board table the above motion and ask the Director of International Relations to present statements in support of his recommendation that AIIE join CIPM. Motion seconded by Mr. Roy. Tabling motion passed 13 to 4. The motion is tabled for consideration at the May Board of Trustees' Meeting.

3g. *Other New Business*

3g1. *Classification of Industrial Engineering Positions by the Civil Service Commission*—Dr. Rathe reported that the Civil Service Commission has released a draft on the proposed new definitions of Industrial Engineering to be used by the Commission. The draft of the proposed change was received by the Professional Relations Committee on October 5. The draft is being duplicated and circulated to members of the Professional Relations Committee. When the Professional Relations Committee has reviewed this document and made their recommendations, the proposal will be circulated to the AIIE Board of Trustees for a mail vote.

3g2. *Requirements for AIIE Delegates to Engineers Joint Council*—Dr. Rathe presented a proposal that defines the requirements for the AIIE delegates to Engineers Joint Council. These requirements have been submitted by a committee composed of Robert S. Rice (Chairman), Dr. William J. Jaffe and Morley H. Mathewson.

Dr. Rathe moved that the Board of Trustees accept the recommendation of the committee preparing them that these requirements be established as policy to be used as a rule in appointing delegates to the Engineers Joint Council. Motion seconded by Mr. Vallette. Motion passed. (Appendix 2—these minutes.)

3g3. *Standards of Industrial Engineering Education*—Dr. Rathe reported that the taskforce working on this project was making better progress than had been expected and that a report could be expected the first of January.

3g4. *Publication of Conference Proceedings*—Dr. Lehrer, as Editor-in-Chief of the *Journal*, asked the Board to consider the re-establishment of a previous policy calling for the publication of the Proceedings of AIIE National Conferences as a regular issue of the *Journal of Industrial Engineering*. Dr. Lehrer stated that this was the only way he believed that a satisfactory financial position in publication of these proceedings could be attained. The recent experience of the Atlanta Conference Committee and the subsequent financial loss in the publication of these proceedings was considered.

Dr. Lehrer stated further that some price, probably about $4.50 to $5.00 per registrant should be paid by the Conference Committee toward the publication of the proceedings. The *Journal* staff would publish the proceedings as a *Journal* issue and distribute them in a paperbacked regular edition to all members and *Journal* subscribers of AIIE. Copies that would be sent to the Conference Committee could be hardbound for distribution to the registrants of the Convention. Additional copies in a hardbinding could be provided for future sale by the Conference Committee and/or the National Headquarters Office.

Mr. Jericho suggested that the Dallas Conference and Convention Committee be allowed to continue with any plans for the 1960 proceedings already too far advanced for change.

After further discussion, President Johnson asked Dr. Lehrer to immediately contact Chairman Dodson in Dallas and work out a plan for presentation to the November Executive Committee regarding the 1960 Conference Proceedings.

President Johnson appointed a committee for study of the permanent plans for future Conference Proceedings. This committee is to consist of Mr. James T. French, Director of National Meetings, Dr. Robert N. Lehrer, Editor-in-Chief of the *Journal of Industrial Engineering*, and Jack F. Jericho, First Vice President. The report of this committee is to reach all Board members for study before the Board Meeting in May 1960.

3g5. *Industrial Engineering Posters*—In response to several requests, brief consideration was given to the possible preparation of posters for distribution to high schools by Senior Chapters and Industrial Engineering Departments of our universities. These posters would be used to publicize Industrial Engineering education to high school students.

3g6. *Staff Reports*—Mr. Alberts suggested and the rest of the Board concurred, that too much time is being spent at Board of Trustees' meetings studying the detail of problems instead of sufficient staff work having been done by the interested parties in advance. The Board of Trustees therefore asks that all future recommendations to the Board be presented with complete details for consideration and that a summary be attached for immediate consideration. The Board further suggests that these recommendations should be distributed to the Board of Trustees' members well in advance so that each Board Member may have an opportunity to consider the details of the proposal prior to the meeting.

Adjournment—The meeting was adjourned at 12:30 P.M.

Next Meeting—The next meeting of the Board of Trustees will be held on Friday, May 13, 1960 at the Sheraton-Dallas Hotel. This meeting will be held in conjunction with the AIIE 1960 National Conference and Convention.

The next meeting of the Executive Committee will be held on Saturday, November 7, 1959 at the Bellevue-Stratford Hotel in Philadelphia, Pennsylvania. This meeting will be held in conjunction with the Second Annual AIIE Northeastern Region Conference and Convention.

Appendix 1

AMERICAN INSTITUTE OF INDUSTRIAL ENGINEERS, INC.
145 North High Street, Columbus 15, Ohio

BUDGET FOR FISCAL YEAR OCTOBER 1, 1959 TO SEPTEMBER 30, 1960

INCOME

1. *Dues*		
a. Member	$52,000.00	
b. Associate	52,000.00	
c. Affiliate	9,000.00	
d. Student	4,000.00	
e. Application Fees	7,000.00	
f. Member-at-Large Chapter Dues	2,000.00	
Total Dues		$126,000.00
2. *Publicity and Publications*		
a. Books	600.00	
b. Journal	10,000.00	
Total Publicity and Publications		10,600.00
3. *Miscellaneous*		
a. Insignia	50.00	
b. Certificates	50.00	
c. Supplies	250.00	
d. Interest	2,000.00	
e. Use of Mail List	1,300.00	
f. Unclassified	500.00	
Total Miscellaneous		4,150.00
TOTAL INCOME		$140,750.00

EXPENSE

1. *Administrative*		
a. Salaries	$47,247.00	
b. Communications	800.00	
c. Postage	5,500.00	
d. Applications	300.00	
e. Stationery	1,000.00	
f. Office Supplies	3,100.00	
g. Office Equipment	800.00	
h. Office Maintenance	450.00	
i. Bank Charges	200.00	
j. Audit	400.00	
k. Ballots	600.00	
l. Business Administrator Expenses	1,350.00	
Total Administrative		$ 61,747.00
2. *Occupancy*		
a. Rent	5,060.00	
b. Insurance	65.00	
Total Occupancy		5,125.00
3. *Publicity and Publications*		
a. Brochures	500.00	
b. Miscellaneous Printing	2,800.00	
c. Journal	35,340.00	
Total Publicity and Publications		38,640.00
4. *Officers and Committees*		
a. Officers	15,070.00	
b. Directors and Committees	4,970.00	
Total Officers, Directors and Committees		$ 20,040.00
5. *Miscellaneous*		
a. EJC Membership	1,500.00	
b. Budgeted Reserve	7,038.00	
c. Contingency Reserve	5,000.00	
d. Chapter Expansion	1,660.00	
Total Miscellaneous		15,198.00
TOTAL EXPENSE		$140,750.00

Appendix 2

REQUIREMENTS FOR AIIE DELEGATES TO ENGINEERS JOINT COUNCIL

Engineers Joint Council decisions can affect policies and practices of each of its constituent member societies. These decisions are developed and concluded by the discussions and votes of delegates appointed by each member society. Therefore, appraisal of selected delegates to represent the American Institute of Industrial Engineers should result in a satisfactory balance of the following specific requirements:

1. *Membership.* A delegate should be a fellow or member of active standing of the American Institute of Industrial Engineers. In addition, he shall have been a member for at least three years prior to appointment to the office of delegate.

2. *AIIE Knowledge and Experience.* A delegate must understand the structure, policies and operating practices of the AIIE national organization and of its chapters. It is preferred that a delegate should have served the national organization, or a chapter, as an officer or committee chairman.
3. *Related Knowledge and Experience.* A delegate should have knowledge and experience related to the work of the EJC committee or board to which he is appointed.
4. *Professional Standing.* A delegate should be (or have been in the case of retired delegates) engaged in a position or business activity that is comparable in level of attainment with those of other EJC delegates with whom he will associate. There should be some evidence that his professional associates recognize the delegate as having professional stature that is above the average.
5. *Character.* A delegate should have demonstrated in his AIIE activity, and in his work in the general field of Industrial Engineering, that he has a positive balance of values with regard to the following: dependability to discharge his responsibilities and commitments; creative talent to generate solutions of problems and ideas for progress; tact and diplomacy in dealing with people; initiative to fill the needs for leadership; and integrity to demonstrate the AIIE creed governing ethical practices.

reader comments

THE ORGANIZATION OF CONTROLLERSHIP, by E. B. Cochran, *Journal of Industrial Engineering,* July-August, 1959.

Just a brief note to say that your staff did an excellent job in handling the printing of the material for my article on "The Organization of Controllership" in your July-August issue. I was also interested in the editorial comments preceding the article which brought out, I thought, rather clearly the close relationship between controllership functions and those which have been designated as "Industrial Engineering" for some period of time. There is considerable common ground, and it is only natural that there be interdepartmental controversies as mentioned by the commentator.

Having been mildly accused of taking a narrow view of Industrial Engineering, I would like to say something in my defense. What appears to be happening is that Industrial Engineering has won a far larger victory than even its strongest proponents yet realize. In effect, the controllership function represents an application of Industrial Engineering proposals and techniques through the medium of financial analyses and broad techniques of management control. I myself, for example, generally hire personnel with Industrial Engineering background and seldom look for people with extensive accounting experience. This inevitably restricts the Industrial Engineering Department proper to basic services of an analytical and control nature for the *manufacturing* organization, and it seems logical to continue to call this function "Industrial Engineering." The name used for the functions performed in the Controller's office (or in similar offices reporting directly to top management performing functional analyses of procedures and operations) may be "Operations Analysis," "Planning Office," "Control Section," etc. The point is that the analytical function has now come of age—owing a good bit to Industrial Engineering efforts—and the name of the department is more or less unimportant. As a practical matter the Controller's Office is coming to discharge these functions for a number of fairly cogent reasons, but in the process is losing its original accounting emphasis entirely. I have discussed this subject at more length in the article, "What Is a Controller," referred to by the article in the *Journal of Industrial Engineering.*

This entire subject of the development and expansion of analytical and control functions out of Industrial Engineering and up to the top levels of management has been of extreme interest to me, and I think a good bit needs to be clarified if sterile interdepartment controversies are to be avoided.—*E. B. Cochran, Budget Manager, Rohr Aircraft Corporation.*

SIMULATION AS A PRODUCTION AID, by John L. Colley, Jr., *Journal of Industrial Engineering,* July-August, 1959.

I have one question about the article entitled "Simulation as a Production Aid." Along about the middle of the first column on page 297 it is stated, "It was decided that since direct mathematical calculation of the probability that two parts chosen at random mating properly would be very difficult, simulation of the assembly by the Monte Carlo technique would be the most expeditious approach."

In view of the fact that normal distribution was assumed for each of the two mating parts, it seems to me that the mathematical calculation referred to is no more than a straight forward application of the propagation of error theory. The average difference between the two parts is the difference of the average dimensions, or .067 — .062 = .005. The standard deviation of this difference is the square of the sum of the squares of the individual standard deviations, which figures out to be .0026. Dividing .005 by .0026 gives 1.93 standard deviations, and the table of areas under the normal curve says that the probability of Part 2 being smaller than Part 1 is .0268. How much more expeditious can you get?

If the individual distributions had been skewed or otherwise non-normal, then the distribution of their differences would likewise have been distorted, but I think I am right in stating that the sum of difference of normal distributions is of itself a normal distribution.

If the foregoing comment is correct, this would seem to me an unfortunate application of simulation, for two reasons. First, it is considerably more trouble to simulate than to calculate. Secondly, the simulation process is subject to sampling errors not encountered in the analytical approach.

REFERENCE

(1) Duncan, Acheson J., *Quality Control and Industrial Statistics,* Richard D. Irwin, Inc., Homewood, Illinois, 1955, p. 72.

—*A. R. Burgess, Head, Department of Industrial Engineering, Agricultural and Mechanical College of Texas.*

AUTHOR'S COMMENTS

I appreciate Professor Burgess taking the time to write regarding my article "Simulation As A Production Aid."

Professor Burgess is correct in his statement that if the thickness of parts A and B are each normally distributed, the difference in size of pairs of A and B, drawn at random, will be normally distributed with mean equal to the difference between the means of

the individual parts and variance equal to the sum of the variances of the individual parts.

At the time I made this study eighteen months ago, I held a B.S. in Industrial Engineering and had completed a basic course in Statistics, a course in Quality Control, and a graduate course in Experimental Statistics for Engineers. I was not familiar with the above relationship at that time and used the simulation approach as described.

Perhaps in this instance I was typical of many thousands of Industrial Engineering graduates who left school with less statistical training than needed. Professor Burgess is correct that the direct calculation is much simpler, provided that is, that the person involved is familiar with the theory. The Monte Carlo process and its successful application, in this instance in a very unsophisticated manner did provide the solution, and it is felt that the results are none the less valid because a theoretical approach existed above the educational level of myself and probably other members of this society.

Again my thanks to Professor Burgess.—*John L. Colley, Department of Industrial Administration, School of Engineering, Yale University.*

Reading the recent article, "Simulation as a Production Aid," by Mr. John L. Colley, Jr., I had a problem that has been somewhat troublesome to me as a teacher displayed in our professional magazine. For far too many students, the powerful simulation techniques become an excuse for failing to think. "Monte Carlo exists, it can solve this problem, why learn other methods?"

As a result of this stimulus, I have prepared the following comments on this situation, together with an analytical solution to Mr. Colley's problem.

The old command to "practice what you preach" is as applicable to Industrial Engineers as it is to men in any other line of work and more so than to most. A large part of the work of the Industrial Engineer is not "doing" alone, but rather in getting others to "do" correctly and, particularly, in getting others to think in a specific way, to think in terms of motion economy, to think in terms of scientific and economic solutions to Industrial Engineering problems. To hope for any success in this direction, the Industrial Engineer must be as careful in his selection of the methods and techniques which he uses as he would like for others to be in their's. In part, it is the matter of setting an example, but, in larger part, it is being fully conscious yourself of the real meaning of these ways of thinking.

An example which has been driven home forcefully to the writer on several recent occasions is the misapplication of simulation or "Monte Carlo" techniques. It should be understood that this is not belittling simulation; it is a powerful tool when correctly used, but like all powerful tools, it presents a very great temptation for misapplication. A description of such a misapplication was published in the July-August 1959 issue of *The Journal of Industrial Engineering* in an article entitled "Simulation as a Production Aid."

In this paper, the problem presented in its simplest terms was that given two parts, A and B, which are produced by independent processes, each producing parts with independent, normal distributions, with known universe averages μ_a and μ_b, and known universe standard deviations, σ_a' and σ_b'; find the probability that, of a randomly drawn pair of parts, A will be smaller than B in the dimension of interest. With respect to this problem, Mr. Colley says, "It was decided that since direct mathematical calculation of the probability of two parts chosen at random mating properly would be very difficult, simulation of the assembly by a Monte Carlo technique would be the most expeditious approach." Basically, there is one fault with this statement, direct mathematical calculation of this probability is very simple. This reverses the expediency of using a simulation technique. Using Mr. Colley's values of $\mu_a = .057''$ and $\mu_b = .062''$ and $\sigma_a' = .001667''$ and $\sigma_b' = .002''$, it can be calculated as follows:

1. The expected difference between paired members of populations whose expected values are known is the difference between these expected values or $\mu_b - \mu_a = \mu_{b-a}$ (2, p. 568). Thus we would expect that the average difference between these two parts would be that part A would be smaller by $.062'' - .057''$ or $.005''$.

2. Since the universes of the parts are normally and independently distributed the distribution of the difference is normally distributed (3).

3. Since the two parts are independently manufactured and chosen, $\sigma_{b-a}'^2 = \sigma_b'^2 + \sigma_a'^2$ (2, p. 569). Then $\sigma_{b-a}{}^2$ may be calculated as $(.002)^2 + (.001667)^2$ or $\sigma_{b-a}' = .0026038$.

4. Then the probability that part A is shorter than part B (the probability that the two randomly chosen parts will mate properly) is the probability that the difference between the two parts is less than the average by an amount less than the average in the unfavorable direction or the probability that the difference deviates from its mean by less than .005 or, normalizing, by less than .005/.0026 standard deviations or 1.92 standard deviations in the unfavorable direction. (All deviations in the other direction will still produce mating parts.)

5. Looking this value up in a table of normal areas(1), it is found that the probability of a good mating under the assumptions given in .9726 and, of course, the probability that they will fail to mate, if the original assumptions are true, is .0274.

The calculation of the solution by this method required eight minutes and no instruments other than a pencil and paper to yield an exact solution while simulation required, according to Mr. Colley, "less than half a day" using a desk calculator even when it was not carried on long enough to provide a close approximation to the value desired.

The simulation method is an excellent tool for use when mathematically exact solutions are not available or are inordinately cumbersome, but where there exists a convenient and direct mathematical solution, the use of prolonged simulation methods is much like driving tacks with a sledge hammer; the tool is sufficiently powerful, but the efficiency is somewhat low.

Columbus 15, Ohio

Professional Relations

PROFESSIONAL RELATIONS ACTIVITIES

Commenting about the air of confusion which permeates the communications media regarding the spheres of interest of engineers, scientists and technicians, Dr. George B. Kistiakowsky, special assistant to the President for Science and Technology had the following to say: "With all due respect to the excellence of their (National Association of Science Writers) intentions, I cannot agree that science is either the cure of disease, the improvement of auto engines, or the production of new fertilizers. In fact, I may go a step further and state that neither is science the establishment of a station on the moon. All these practical accomplishments are notable triumphs of engineering and technology, but they are not science as such.

"To stress the difference between science and technology is not to imply value judgments, for each is equally necessary to our society. The danger is that through lack of understanding of the nature of scientific research and what it requires in order to flourish, we may fail to cultivate it adequately."[1]

The scientists are not alone in their plight of suffering from the lack of a clear public image. The image of the engineer isn't exactly in focus.

Being fully aware of the problem, the Public Relations Committee of the EJC is carrying on a quiet but intensive campaign to help clear some of the public confusion regarding the engineers' image. An article in an earlier issue of the *Journal* acquainted you with the details of this campaign. Briefly, it consists of a series of six (6) institutional type advertisements designed to sketch a simple statement of fact about engineers and engineering. The specific objective of this campaign is to overcome the lack of real understanding on the part of editors and writers as to just what an engineer is and just what an engineer does. The ads are appearing from time to time in the trade journals of the journalistic field.

This series of advertisements like the first series on behalf of the engineering profession will appear in *Editor and Publisher*, the business magazine of the newspaper profession. In one of the ads, Engineers Joint Council welcomes inquiry by editors, newspaper and television writers concerning the obscure phrases that may occur in description of engineering jobs. After all, says the ad, every occupation has its jargon, and why should the public understand the meaning of "creep and fatigue," an engineering phrase, any more than it would understand "killing widows," a newspaper editor's phrase.

If coverage is the main criterion of success, then judging by the following statistics success is assured.

"Quarter-page ads were scheduled in *Editor and Publisher*, placed to advantage on pages surrounded with appropriate editorial copy (one story on the missile program, another on the reporter's role in government) on June 20, August 29, September 26, October 24, November 21 and December 21. These ads are seen and read by 20,000 publishers, editors, reporters, radio newsmen and ad agency men, who control the news and much of the nation's written current material on newspapers and magazines. For instance, the ads reached 1413 newspapermen on 43 metropolitan dailies in the 12 largest cities; 1500 daily newspapers with circulations under 50,000; 786 executives of wire services and syndicates and 500 subscribing newsmen in Washington."[2]

The Public Relations Committee of EJC feels that the campaign is accomplishing its purpose, namely to set straight editors, newswriters, and ad agency copy writers on their understanding of engineers and engineering to the benefit of the engineering profession. See if you can see the difference in your favorite newspaper and magazines.

Prepared for Professional Relations Committee
By Harry L. Davis

One of a series

Just Who's Firing Those Missiles?

From the news stories you might think that Cape Canaveral is populated only by scientists and electronic brains. As a matter of fact, much of the design, construction and operation of our missiles and satellites is the work of engineers. Engineers don't want to take credit from the scientists, upon whose original research the missile program is based, but they do feel that the public should recognize engineering as a major force in the missile program.

Engineers Joint Council has been established by the engineering profession of the United States, to help you make the public properly aware of what the engineers are doing. For facts about engineers and the engineering profession, check with—

Creep? Fatigue?

Every occupation has its jargon. You, for instance, could baffle the man on the street with talk of "killing widows."

You avoid jargon. You don't print your own and you translate that of other professions or trades to make the news understandable to your reader.

Engineering has its jargon—just as medicine or any other profession. Maybe you haven't realized it before, but strong metals do "creep". And they do "fatigue."

Engineering's jargon is as readily translated as your own profession's. When you need help on an engineering story, consult—

The Big "W"

Who, what, when, where and why still belong somewhere in the news story. And who still leads the list.

Your theater columnists don't review plays without naming the actors. Your book reviewer names the author. Your whole staff is aware that names still make news.

Too often, engineering news events are reported as if they somehow, miraculously, got done, happened, evolved.

A bridge is built. A mine is opened. A process is developed. A product is perfected.

People, engineers, do all these things; they don't just happen. Engineers with names are the creative minds behind every engineered product and project you report. Use their names and make all those passive verbs active.

Engineers Joint Council

AUTOMATION

"Simple Mechanization Pays Off," J. E. Harbuck and F. J. Ramondini, MODERN MATERIALS HANDLING, *page 107, September, 1959.*

A basic approach to mechanizing job-lot assembly without spending a fortune is outlined in this article. The authors list the ten principles that guided their layout planning for gear motor assembly where production varied from steady production of few models to special job lot models. By providing a unique yet simple conveyor system that carries all types of assemblies to the common operations of painting, testing and packing, they have cut total cycle time 66 percent. (*N. E. Sparks, Ethyl Corporation*)

"Data Center for Automatic Production Control," MACHINE DESIGN, *page 29, July 23, 1959.*

Paper-and-pencil methods of production control—even those built around manual data-display boards—may soon be outdated by new automatic equipment. One front-runner in the race to automatize production data keeping is Productograph, an instant-tally system that reports and correlates work output and downtime of every machine in the shop.

"Better Decisions on Mechanizing," Gerald E. Johnson, FACTORY, *page 62, July 1959.*

When a mechanization project doesn't pay off, what's wrong? Chances are, somebody flubbed on dollars. Here are practical tips on practical cost figuring. (*B. M. Bryant, Ethyl Corporation*)

COST CONTROL

"Pinpointing Soft Spots in Costs," Donald Hoodes, FACTORY, *page 68, April, 1959.*

Do big-money figures mystify you? Then break them into little pieces. You'll find opportunities for pinpointing soft spots in costs.

GENERAL

"The Creative Engineer, Part 1—Personality Trait" Eugene Raudsepp, MACHINE DESIGN, *page 22, May 28, 1959.*

Why do some engineers frequently have "brainstorms" while others seldom even have "good ideas"?

To answer this question, the author has surveyed experts on creativity across the nation. Engineering and research managers, professors, philosophers, psychologists, social scientists, consultants —all working with creative people—have provided information. This three-part series identifies—for the first time anywhere—thirty major attributes of the creative engineer.

"The Creative Engineer—Part 2—Intellectual Abilities," Eugene Raudsepp, MACHINE DESIGN, *page 28, June 11, 1959.*

The thirty attributes discussed in this three-part series of articles are of value to everyone concerned with the creative process. The engineer, through understanding the basic characteristics of creativity, can consciously develop those characteristics he does not already sufficiently possess. The interviewer charged with hiring creative personnel can use the thirty as a nucleus for intelligent

questions to evaluate the potential of each technical applicant. The manager will find them an aid in understanding creative people and an aid in fostering an atmosphere conducive to creative work.

"The Creative Engineer—Part 3—Mechanics of Creativity," Eugene Raudsepp, MACHINE DESIGN, *page 27, June 25, 1959.*

Eight such techniques for creativity uncovered in a survey of experts are reported in this concluding article.

"Patent Fundamentals," D. W. Karger, MACHINE DESIGN, *August 20, 1959.*

Ideas are not inventions, Neither are patents. Ideas are the prelude to invention and are the tools of the inventor. They are not patentable. Patents are merely the legal documents that describe claim inventions. Here is a basic guide to what the company and engineer should know about handling ideas, inventions and patents.

"Parke Davis' Cure for Truck Breakdowns," M. Berko, MODERN MATERIALS HANDLING, *page 122, September 1959.*

Dividing maintenance responsibilities for battery-powered industrial trucks among various crafts presented a most difficult scheduling problem at Parke Davis, and it was repair rather than preventive work. By setting up a preventive maintenance shop with scheduled inspection based on installed engine hour meters, Parke Davis have solved craft scheduling problems, reduced equipment downtime and pinpointed specific equipment whose abnormally high maintenance cost should prohibit its continued use. (*N. E. Sparks, Ethyl Corporation*)

"Statistics Show Human Side of Maintenance," CHEMICAL WEEK, *page 125, August 29, 1959.*

A new look at the human factors of maintenance—the evaluation of attitudes and work habits from a currently-in-progress study by the Aero Medical Laboratory of Wright Air Development Center (Dayton). The study shows that worker skill isn't quite the sole determining factor as long as supposed. (*J. M. Barksdale, Ethyl Corporation*)

"The Organization Theory of Henry Gantt," Arthur Svenson, ADVANCED MANAGEMENT, *page 16, August 1959.*

Though management's role grows increasingly more complex, the basic tenets evolved four decades ago by one of the pioneers of scientific management still apply today.

"Characteristics and Organization of the Oral Technical Report," GENERAL MOTORS ENGINEERING JOURNAL, *page 74, April, 1959.*

The oral technical report is becoming more popular as a means of communicating information within industry on a variety of subjects. Its effectiveness depends to a large extent on the delivery qualities of the speaker. To be effective it must be presented on a level the audience is able to comprehend. Proper organization is vital for an oral technical report. A checklist has been devised by General Motors Institute that summarizes the important points to remember in preparing and presenting the oral report. (*J. M. Barksdale, Ethyl Corporation*)

"Job Description for Executives," John K. Hemphill, HARVARD BUSINESS REVIEW, *page 55, October 1959.*

Many companies are dissatisfied with the conventional methods of analyzing executive jobs. Here is a new approach that measures managerial responsibilities in terms of ten dimensions, for purposes of selection, assignment, and promotion.

INVENTORY CONTROL

"Automatic Control of Warehouse Flow," R. W. Roop, MATERIALS HANDLING ENGINEERING, *page 64, October, 1959.*

To operate a warehouse automatically requires step by step mechanization of each functional operation. According to Mr. Roop, automatic control is now economical for many aspects of warehouse operation. For others, the time is coming. He tells how automatic carton readers, diverters and palletizers can bring labor reductions on handling at the end of conveyor lines. Roop also discusses the application to distribution warehouse and to transfer warehouses. (*N. E. Sparks, Ethyl Corporation*)

"Fastest Warehousing You Ever Saw," FACTORY, *page 68, July, 1959.*

Within minutes this new automatic warehousing system at Reliance Electric & Engineering Company gets an order on its way. It's a brand-new approach to storage and order picking. Key to the system is the Retriever that rushes motors into or out of storage. Benefits? Three big ones:

50% more usable storage space.

Orders go much faster.

Just one man (and four units) can do the whole job. (*B. M. Bryant, Ethyl Corporation*)

MATERIALS HANDLING

"Automatic Container Filling," by the Editors, MATERIALS HANDLING ENGINEERING, *page 74, October, 1959.*

How do you handle many products in a variety of containers on an assembly line? Magnolia Petroleum Company at its Beaumont, Texas refinery has built a Blending and Packaging Plant designed to avoid double handling and double payroll. On its conveyorized assembly line, a high degree of automation is achieved in drum filling and handling. (*N. E. Sparks, Ethyl Corporation*)

"Planning a Handling System" by L. M. Polentz and Dr. R. R. O'Neil, MATERIALS HANDLING ENGINEERING, *page 67, October, 1959.*

Difficult problems in the development of the atomic bomb were solved with the Monte Carlo method. Now the authors describe how this same technique can be used to predict accurately how long a new cycle of operations will take by using data from previous time studies. It is also used to tell how much waiting time there will be between operations. (*N. E. Sparks, Ethyl Corporation*)

"Selection and Use of Pneumatic Conveyors," by H. S. Sayre, MATERIALS HANDLING ENGINEERING, *page 66, September, 1959.*

The fifth in a series of articles furnishing technical information on all types of conveyors. It describes how pneumatic conveying can bring increased productivity, time saving, and lower labor costs for a variety of materials ranging in densities from 75 to 250 pounds per cu. ft. and in type from large metal parts to wood chips. (*N. E. Sparks, Ethyl Corporation*)

"Plan Buildings for Handling," by Editors, MATERIALS HANDLING ENGINEERING, *page 71, September 1959.*

This article gives several examples of how designing buildings for materials handling has resulted in convenience to customers, adequate handling for high-production, and elimination of manual labor. (*N. E. Sparks, Ethyl Corporation*)

"Gravity Flow: Biggest Problem of Bulk Material Users," by Paul O. Berg, MODERN MATERIALS HANDLING, *page 117, September, 1959.*

In Part I of a three-part series, author Berg relates how bin unloaders and flow aids can give continuous and uniform flow of bulk materials. Specific devices are described which eliminate hopper banging and material hang up for a wide range of animal, vegetable and mineral materials of every conceivable size, shape, consistency, liquid-content and form. (*N. E. Sparks, Ethyl Corporation*)

"Are Wooden Pallets on the Way Out?", by Gordon C. Thomas,

Packing Editor, MODERN MATERIALS HANDLING, *page 104, September, 1959.*

W. H. Sardo, Jr., of the National Wooden Pallet Manufacturers Association answers this question in the negative in an interview with editor Thomas. He points out that the new low return rate granted by carriers on empty pallets, and the pallet pool (brought on by standardization of pallet size range) have recently shifted emphasis away from palletless handling, expendable pallets and new pallet materials and have reemphasized wooden pallets. (*N. E. Sparks, Ethyl Corporation*)

"Handling with Hoists," by Editors, MATERIALS HANDLING ENGINEERING, *page 74, September, 1959.*

Each type of hoist must be regarded in relation to a specific job. This article mentions purchase price, cost of operating the hoist, cost of man hours saved or lost by its use, and the cost of maintenance as all being part of the real cost of a hoist. Eight rules to follow in hoist selection are treated individually. (*N. E. Sparks, Ethyl Corporation*)

"Using Statistics to Analyze Materials Handling Problems," W. J. Richardson, MECHANICAL ENGINEERING, *page 54, May 1959.*

Certain basic concepts of statistical analysis are extremely useful when applied to materials handling: how to collect and classify data, how to construct a frequency distribution, and to apply sampling techniques to everyday materials handling. (*B. M. Bryant, Ethyl Corporation*)

OPERATIONS RESEARCH

"Turning Minor Changes into Major Savings," CHEMICAL WEEK, *page 75, October 24, 1959.*

This article reviews a technique that permits the plant operator to run process improvement "experiments" without tampering with the product or production.

The technique is known as EVOP—Evolutionary Operation. It can be made a permanent part of operating procedure because it doesn't upset product quality and yield. And, it doesn't add to plant costs or require the assistance of technical personnel from research or development departments. The technique has been applied successfully by several large chemical companies. (*J. M. Barksdale, Ethyl Corporation*)

QUALITY CONTROL

"Quality Control Program Gages Production of Consumer Goods," IRON AGE, *page 82, August 27, 1959.*

High-speed production of consumer goods requires a practical program of quality control.

This down-to-earth program in a powermower plant looks at the final product from the customer's viewpoint.

SYSTEMS AND PROCEDURES

"There's No Mystery to Designing Forms for Automatic Systems," Ray Marier, THE OFFICE, *page 130, October 1959.*

This is an answer to the growing myth that needs to be corrected before it is accepted as a truism, the canard that forms design for automatic data processing belongs in a class by itself.

"The Best Ways to Coordinate a New Procedure," Leslie H. Matthies, THE OFFICE, *page 79, October 1959.*

To coordinate a procedure between several departments, the systems man must work with great care and finesse. Recoordination is even a tougher task.

WORK MEASUREMENT

"An Inexpensive Method of Work Sampling," C. B. Gambrell, Jr., J. W. Barney, THE OFFICE, *page 82, October 1959.*

Describes a technique of automatic work sampling through the use of a camera with a constant speed drive an automatic timer to actuate the camera at random intervals.

"The Truth About Wage and Work Measurement Today," FACTORY, *page 74, April 1959.*

This is the survey you've been waiting for. It will tell you how management men in 785 plants see these controversial tools—how they use them—what the gains (and pitfalls) are—what's needed to make them work better.

"Making Incentives Work," Frances Torbet, HARVARD BUSINESS REVIEW, *page 81, October 1959.*

Once heralded as a panacea for all labor-management problems, the effectiveness of individual piecework is threatened by technological change. But group incentive plans can still help employers achieve better worker participation and productivity.

SENIOR INDUSTRIAL ENGINEERS

UNITED STATES BORAX & CHEMICAL CORPORATION invites highly qualified engineers with a minimum of five years' experience to become associated with a newly organized function.

Qualifications should include experience in supervision of work measurement and work simplification programs, preferably in process or mining industries.

Permanent positions are available at plant locations in California and New Mexico. General resume of education and experience in first letter. All replies will be held in strict confidence. Send resume to: George L. Anton, Director of Industrial Engineering.

U. S. BORAX & CHEMICAL CORP.

630 Shatto Place, Los Angeles 5, Calif.

BANNERS FOR SENIOR AND STUDENT CHAPTERS

Cost $75.00

4 x 8 ft., blue and gold felt, with a blue, gold and white embroidered AIIE insignia in the center

Available from: AIIE Headquarters
145 North High Street
Columbus 15, Ohio

(Allow about six weeks for manufacture and delivery)

ie opportunities

WHAT IT IS

The I.E. Opportunities service is a functional committee activity of the AIIE. Information concerning employment opportunities is collected on a nationwide basis and is provided without charge to members upon request. The committee is composed of members from the Columbus, Ohio chapter.

SERVICES PROVIDED

Current job openings are published in condensed form in each issue.

In addition, a monthly I. E. Opportunities Bulletin is supplied to over one hundred chapters located throughout the United States.

Each job opening is assigned a **"P"** number for identification. The name and address of the person to contact for additional information concerning a specific job opening is sent to members on request.

EMPLOYERS

Employers having openings for qualified Industrial Engineers are invited to list them. Government agencies and educational institutions as well as business and industry are urged to take advantage of this free service.

Industrial Engineers are often employed in such fields as Work Measurement, Production Control, Plant Engineering, Operations Research, Industrial Relations, Sales, and Management. For a more complete coverage, see the following list of job classifications. Please do not hesitate to forward information on jobs in any area where it is recognized that an Industrial Engineering background will be of value.

To list your job openings with the Opportunities Service, send all or part of the following information with the name of your contact man to the address below: Type of industry, location, job classifications, minimum educational and experience qualifications, and salary range.

This information will be publicized to the members in condensed form in the JOURNAL and in monthly chapter Bulletins. Company names are not shown.

MEMBERS SEEKING JOB OPPORTUNITIES

The following list shows job openings available just prior to press time. If you would like more information about one or more of the positions listed, mail the **"P"** numbers with your name and address to the Opportunities Service at the address below. The Service will advise you by return mail of the name and address of the person to contact for further information, or advise you if the position is no longer available. Your name will not be forwarded to the company with the job opening.

For more current listings, contact your local Chapter Secretary or Opportunities Chairman for the latest monthly Bulletin.

(To be continued in March-April issue.)

Each member has been assigned a Membership Code Number which appears to the right of the address. The first digit indicates the Chapter to which he belongs (0—if he is a Member-at-Large). The letter (or letters) indicates his classification (F—Fellow, M—Member, A—Associate, AF—Affiliate). The last digit, following the dash (-) is the Annual Dues Code (-1 = $12.50, -2 = $15.00, -3 = $20.00, -4 = $22.50, -0 = $0.00, -S = Special rate).
